WALLACE'S MONTHLY.

VOL. XVIII. DECEMBER, 1892. No. 10.

tered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

ERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

KREMLIN 2:07 3-4.

BY AN ADMIRER.

THE apparent ease with which Kremn, on his first attempt, secured the stallon championship, by trotting the Cumerland regulation track, at Nashville, enn., on November 5, in 2:08¼; and gain, on November 12 in 2:07¾, marks im as the sensational horse of this year. his achievement, coming as it does, on he heels of a series of triumphs, unenaled by any other stallion, in which his five-year-old defeated the fastest rotters of the country, proclaims him a riple king—king of trotting race horses —king of stallions and king of five-yearlds. Take him all in all, it is no exageration to consider Kremlin as the most emarkable trotting horse of the age; nd a brief history of such a horse—hich has come to the knowledge of one f his admirers—can not fail to interest he readers of the MONTHLY.

On April 8, 1887, the Woodford Mamrino mare, Eventide, foaled, at Woodurn Farm, Kentucky, a bay colt, sired y Lord Russell; and, at that far-famed ursery of trotters, this colt passed, uneventfully, the first two summers and inters of his existence. He was broken o harness, spoken of as "well gaited nd very promising," as many another olt, whose name never becomes famous, s and has been. He was large for is age, strongly muscled and well mit—not a handsome looking colt by ny means—and rather plain and heavy hen nearly three years old. But his ait was good, his breeding of the choicest; and, to the eye of a connoisseur, power and capacity for speed were discernible; while maturity would round and finish those plain appearing lines into the highest form of race-horse beauty. Hence, so well was he thought of, that he remained for over two years, the highest priced colt on Woodburn's sale list, until, in one of his periodical visits, Mr. William Russell Allen, who had watched the colt's growth from time to time, with increasing interest, decided he was good enough to be given a place with the other trotting treasures at Allen Farm, Pittsfield, Mass. This was early in 1890, shortly before the engagement of Edwin D. Bither, as trainer for Allen Farm; and the colt still remained at Woodburn, no mention of the sale having been made to any one. In order that the youngster might be developed on his own merits, without any reference to his breeding, Mr. Allen, in a very characteristic manner, wrote in this way about his new purchase: "When you "get settled at Hartford, I will send you, "in addition to what you now have, a "three-year-old colt, to train. He is "plainly bred, but I believe has some "speed." These were all the information and instructions vouchsafed. On May 26 of that year, a big, strong, three-year-old bay colt was duly delivered at the Charter Oak Park, Hartford; but the colored shipper knew nothing further than that he had brought the "stud" from New York city; at least no further

information could be extracted from this source. After recovering from a slight cold contracted on the trip, this three-year-old was so full of play and spirits that a kicking strap was found a useful adjunct to the harness; and so little did the visible effects of his previous education impress his trainer, that a breaking cart was also called into requisition. Yet the colt and his driver got along so amazingly well together, that, without any attempt to hasten speed unduly, Mr. Allen, toward the end of July, saw an easy mile trotted in 2:27½, and concluded to test the youngster in a race. The stable was going to the Northwestern Breeder's meeting at Chicago, in the following August, and the colt—for entry in the 2:32 class—was named Kremlin. The name and the breeding then became known, and has since been public property.

There were seven starters in Kremlin's first race and all were older and trotters of experience. It proved a seven heat contest, and was finally won by Navidad, the Palo Alto representative, who, in California, had shown that spring half miles in 1:07. Kremlin, however, gave a taste of his mettle. After recovering from the scare caused by his unusual surroundings, he won the fifth and sixth heats in 2:22¼ and 2:23¼. The loss of the race was really attributable to a poor start in the final heat. His maiden effort surprised the public and pleased his owner, for these were the fastest fifth and sixth heats ever won by a three-year-old. At the Cleveland meeting of the N. A. of T. H. Breeders, a working-out mile close to 2:20 gave Kremlin a walk-over in the stake race for colts of his age. Unfortunately he had no further engagements, but accompanied the stable to Lexington Ky., where, on October 9, in his work, he was timed by Mr. Brodhead and several other prominent Kentuckians, two miles in 2:21 and 2:18¾. During the progress of the Kentucky Breeders' meeting, Kremlin made two ineffectual attempts to lower his race record; the failure being in part due to the exceeding hardness of the track, and also, possibly to the fact that he had trained "off" from the high form he showed earlier in the month. Soon after, he went into winter quarters at Allen Farm, an absolutely sound colt without puff or blemish; and, as he had during that season twice trotted a quarter in 33 seconds, it was generally believed, that with another year's training he should be able to round out a mile at that rate, or in 2:12.

Such a reputation coupled with his superb breeding and superior individuality, made Kremlin many friends at his New England home. His stud book soon filled at the modest fee of $150, and, but for a positive prohibition when reached, the limit of his public services might readily have been doubled. The entire season of 1891 was passed in the stud. No fast work was given him during that year, or the following winter and spring; and, with his daily jogs among the Berkshire hills, Kremlin kept steadily growing more vigorous, gaining in strength and improving in form. These were his first stud services, so that his *oldest* and only foals are those of 1892. During the past year, his season closed on June 15, and on the 22d of that month he was shipped with the Allen Farm stable of trotters to Meadville, Pa., where he went into active training. The fastest mile he had trotted on the farm half-mile track was in 2:37, but he finished the last eighth of this mile in 15 seconds—a two-minute gait, and this was the first time he had been called on for a burst of speed since he had been retired from training in 1890.

Kremlin's five-year-old campaign of the past season is a matter of public record. His first start was a most unfortunate one. At Mystic Park, Boston, on August 11, in the 2:23 class, after plainly showing ability to play with his field by winning the first two heats in 2:20¾, he seemed suddenly overcome by the oppressively hot and sultry atmosphere, and prudence caused his withdrawal at the end of the next heat. Having apparently fully recovered from this temporary disablement, and the originally intended nominee having gone amiss, Kremlin was the selection for the Allen Farm subscription in the great Charter Oak $10,000 stake for 2:20 trotters, and here he got his first taste of free-for-all material. Being

The Transylvania stake has gone on record as the greatest race ever trotted. The size and quality of the field, the number of starters that were winners of previous races over first-class material in record-breaking time, the pink of condition in which they came to the score, and the uncertainty among so many good ones as to which should be the victor, rendered this the most memorable event in trotting annals. The betting was the heaviest ever known in Kentucky on a trotting race; but, so evenly matched were the chances considered, that the odds against the favorite (the black mare Nightingale) were about five to one. The odds against Kremlin were almost ten to one. That the contest should be fierce and long drawn out was universally believed. That any horse could finish it in straight heats was not to be thought of for a moment. To one who, after tedious scoring, saw Kremlin from a rear position, get the word when off his stride, quickly settle himself and overtake such a field of "nonpareils" at the half-mile pole—forge to the front in the next quarter, and with a mighty rush down the homestretch, challenge Little Albert, the leader, shake him off at the distance, and finish eased up in 2:11½—the winning of this first heat will live in memory as the grandest exhibition of equine speed and courage it was ever man's lot to see. Kremlin trotted the last half of this mile in 1:03¾, and finished the last quarter in 30½ seconds, a 2:02 gait. No wonder

Digitized by Google

that Kentucky felt proud of Kremlin, the greatest stallion that state ever raised; and it is not for one of his admirers after witnessing such a victory, to find fault with those Kentuckians who insist that Kremlin is the greatest trotter the world has ever produced.

After the scandalous collapse of the Columbia, Tenn., meeting, at which Kremlin had an evident mortgage on the 2:19 $10,000 stake, no other method of further testing his superiority was available save a mile against the best stallion record, that of Stamboul 2:08½. This was accomplished on the first trial at Nashville, Tenn., on November 5, and although the day was cold, and the track somewhat soggy and slow, Kremlin had no difficulty in trotting to a record of 2:08¼ in a most evenly rated mile, the quarters being done in 32½, 32, 32 and 31¾ seconds.

On November 10, the news came that Stamboul had placed the stallion record at 2:08 on the previous day, having the advantage of California climate and a kite track; and as soon as the heavy rains would permit of the Cumberland track being used, which was on November 12, Kremlin again wrested the crown from Stamboul by trotting in 2:07¾. The rains of the previous week prevented both the horse and track from being in their best form, so that under more favorable conditions Kremlin may, should a further effort be made, carry even a faster record into winter quarters. As it is, the record is phenomenal. It displaces the five-year-old record of Sunol, 2:08¼, and Allerton, 2:09¼—both made on kite tracks. Unquestionably Kremlin is the fastest trotter that has yet appeared.

Kremlin stands 15.3½ hands high, and weighed last May 1,140 pounds in hard road condition. He is a solid bay, without any white, with black legs—the black markings extending above his knee and hocks. He is a horse of finish and symmetrical build, well balanced and adjusted in every member. He is essentially a trotting horse of rare beauty, the word "beauty" being used in its true sense of proper adaptation of means to an end.

The one prevailing characteristic of his physical make-up is power—power in every line and muscle. The distinctive features of his build are an exceedingly broad and full forehead, a slightly "dished" face, a windpipe of remarkable capacity, flaring trumpet-like at the throttle, a conformation necessarily accompanied by great width between the jowls; shoulders of uncommon muscular development particularly at the junction of the withers; stifles of extreme muscularity, for while broad across the hips. there is a very noticeable bulge at the stifles; straight hind legs. It is superfluous to add that he has great chest capacity, both in depth and width. His barrel is well sprung, and he is short backed and closely ribbed up. His public performances guarantee the exceptional quality of his legs and feet.

Under ordinary exercise the disposition of Kremlin is gentleness personified, there being an independent air of quiet nonchalance that is peculiarly his own. In the stable his disposition borders on the phlegmatic, for no harnessing or unharnessing of horses or colts, or the passing or proximity of mares, disturbs his serene composure. But, roused into action his mental energies seem to glow at a white heat. He is all life, a veritable equine incarnation of force, energy, determination, a horse that

> "Would meet a troop of hell
> At the sound of the gong,"

and, it may be added, would beat them out at the wire.

His gait, as may be judged from his speed, is the poetry of motion; no waste action, but elastic, quick and true. He is a natural trotting machine: his body is propelled straight as an air line, and his legs move with the precision of perfect mechanism. He carries shoes of ten ounces in front and five behind.

The breeding of Kremlin is on a par with his grand performances, and that it should be so is cause for congratulation by every breeder who believes in the best strains of trotting blood being used in order to establish a breed of trotters. Kremlin is a magnificent champion of the "Trotting Register," as well as a world's champion. The cause for his

Digitized by Google

nderful speed is found in his pedigree, ose simple tabulation is its own best ogy:

KREMLIN 18327.

Rec. 2:07¾ (5 yrs.)

- LORD RUSSELL 4677. Brother of Maud S.....2:08¾. Sire of Kremlin (5 yr.)....2:07¾. And 14 others in....2:30. Grandsire of One in 2:30 at 11 years.
  - HAROLD 413. Sire of Maud S.....2:08¾. G. sire of Kremlin...2:07¾. G. G. G. sire of Alix, 4 years.....2:10.
    - HAMBLETONIAN 10.
    - ENCHANTRESS. Dam of Lakeland Abdallah.
  - MISS RUSSELL. Dam of 5 with records 2:08¾ to 2:28. Nutwood 2:18¾ and 4 other speed-producing sons. 4 speed-producing daughters.
    - PILOT JR., 12. Sire of dam of Jay Eye See.....2:10. (pacing 2:06¾.)
    - SALLY RUSSELL. G. dam of Zincali Golddust.
- EVENTIDE. Dam of Kremlin.....2:07¾. Everemond.....2:24¾. Erin.....2:24¾. and 3 speed producing sons.
  - WOODFORD MAMBRINO 345. Record 2:21¾. G. G. sire of Alix 4 yr..2:10.
    - MAMBRINO CHIEF 11.
    - WOODBINE. Dam of Wedgewood 2:19.
  - VARA. Dam of Vatican.....2:29¼. Sire of Belle Vara, 5 yr.....2:08¾.
    - HAMBLETONIAN 10.
    - VENUS. Graniam of 6 speed-producing sires. D. G. dam of

The speed producing capacity of Kremlin's direct maternal line to the third remove is the most remarkable part of this singularly rich and well-balanced pedigree. The American star mare, Venus, conveys this capacity through her three daughters, Vara, Vassar and Vesper Belle, dam of Numero, 2:27, and g. dam of Bianca, 2:25½. By far the most successful of those three channels is Vara, who enjoys the unique distinction of being the only mare whose son and daughter, Vatican and Eventide, have each a representative in the 2:10 list. She is also the dam of Woodburn Hambletonian. Vatican has a record of 2:29½, and is the sire of Belle Vara, five years, 2:08¾, Brown Velvet, 2:20½, Vassar, three years, 2:21¾, and others. Eventide is the dam of Kremlin, 2:07¾, Evermond, 2:24¼, and Erin, 2:24¾. All three are by different sires—Lord Russell, Harold and Belmont.

She has also three speed producers amongst her sons, viz.: Erelong, Evermond and Ion. Erelong has four trotters in the list, headed by that game and perennially campaigned gelding, Solong, 2:13½. Patsy Curtis, four-year record, 2:16½, is Everemond's fastest trotter. Vassar, the other daughter of Venus, is the dam of Oak Hill; Vacher, Valdemeer, 2:28, and Vasco, all sires of 2:30 trotters.

The two latter are sired by Harold, the former by Woodford Mambrino. Vasco, at ten years, is a most promising sire, having as speedy and good three-year-old trotters as Bill Lindsay, 2:18½, Valissa, 2:19, and Isa B., 2:23¾, besides others in the list. It is proper to add that Belmont has contributed materially to the success of this family, for Vassar, Vesper Belle, Vatican, Erelong, Erin, Ion and Woodburn Hambletonian are sired by him.

From this brief sketch of the maternal family tree, it will be seen that no family of its age and opportunities is producing and reproducing speed with more certainty and success; for Venus has, so far, six grandsons and three great-grandsons of proven prepotency. None of these horses have been favored by fortunate surroundings. Hence their success, under adverse conditions, is all the more meritorious.

The other crosses of Kremlin's pedigree are too well known for comment here. Some fast trotters have been disappointments in the stud. But no stallion of anywhere near his speed has inherited such a wealth of demonstrated "prepotency" as the family history of Kremlin discloses throughout every line. There is no such cross as "fail" in this pedigree. Through American Star, Hambletonian, Woodford Mambrino, Lord Russell, it is an ascending scale of excellence and success.

Kremlin's ultimate speed even now is a matter of conjecture. If the usual course that has been pursued with other

Digitized by Google

champions, of persistent training for several seasons, is followed in his case, it is quite within the bounds of probability that Kremlin will come nearer the two-minute mark than any trotter has yet done. Stamboul, from 2:17¾ at five years, has reached 2:08 at the age of ten. Nancy Hanks at six years lowers her 2:09 record to 2:04. But whether Kremlin carries his record further into the domains of time, or rests satisfied with laurels already won, that he will have a wonderfully successful stud career is a certainty, and that he will form one of the chief corner-stones on which the future two-minute trotter will be built, is a calmly settled conviction of at least one ADMIRER.

PROBLEMS IN FARRIERY.

Weight-Bearing Portions of the Foot.

THE USES OF THE SOLE.

WHEN the specific answers to correspondents interrupted the series of papers on this subject, the use of the wall as a primary weight bearer was traced as the fundamental principle of farriery in all countries and at all stages of its progress. Diversity of opinion became radical when the uses of the frog were discussed. The same contrariety of conclusion follows the question of the uses of the sole. Taking Professors Gamgee and Fleming as the leading modern antagonistic authorities, Mr. Fleming claims the sole is a primary weight bearer. "To "remove," he says, "the excessive growth "of the wall is an absolute necessity, *but* "*to denude the sole of its horn is wanton* "*injury to the foot and injury to the* "*animal.* When subjected to wear, the "sole is reduced naturally, but if this is "not sufficient to reduce the sole, it is "reduced, nevertheless, naturally. It "falls off in scales. The process of ex-"foliation is not a natural one. These "flakes then act as a natural stoppage to "the hoof, by accumulating and retaining "moisture beneath, and this not only "keeps the foot cool, as it slowly evapo-"rates, but secures for the solid and grow-"ing horn its toughness, elasticity and "proper development."

Professor Gamgee boldly discards all these explanations and precautions as purely fanciful and unpractical.

On page 69 of his elaborate volume he adds:

"I remove the exfoliated sole by "means of the buffer, raising the loose "flakes of horn from the point backward "by tapping the tool with the hammer."

With reference to its weight-bearing capacity they stoutly differ on the laws of growth that govern the sole. Mr. Fleming contends that "the sole only in-"creases its substance to a certain thick-"ness, *never too much*, and then the "excess is thrown off in a natural "manner."

Professor Gamgee, on the contrary, firmly denies these statements.

"It might appear," he adds, "that the "disengaged horn, the thick imprisoned "sole, and the exfoliations of the frog, "if left unheeded, would fall in time— "plausible theory, but incompatible with "good practice.

"When there are morbid accumula-"tions of sole, which come into the way, "and are as much foreign and incom-"patible with its functions as a snow "ball at the bottom of the foot, they are "met and easily broken up by the direc-"tion by which the buttress is pushed "(by the continental farriers) from heel "to toe."

Now upon so simple a fundamental proposition as that relating to the laws of growth which govern the sole there should be no didactic disparity. In the normal hoof the sole undoubtedly exfoliates, and in the slow process of time drops off in scales. But this process of

Digitized by Google

exfoliation is rarely equal to the amount of wall removed at every dressing preparatory to reshoeing. If the sole was untouched, and the wall was cut or rasped to a level every three or four weeks, the tardy exfoliation of the sole would bring it down to the level of the wall.

Then it would become a primary weight bearer coequal with the outside crust. But the sole has variations of growth, both as to rapidity and texture, which change its exfoliations, dependent upon the relative growth of the wall at the toes and heels.

In flat foot the sole is extremely thin. In the contracted hoof it grows to an enormous thickness. Mr. Fleming states that the natural thickness of the sole is about equal to that of the wall. Actual measurement in a large variety of green feet, by the writer, places its thickness at from one-half to two-thirds the thickness of the wall at the toes. The author has one specimen of widely extended flat foot, in which the anterior face of the sole is not more than one-sixteenth of an inch thick, while another hoof, in which the quarters are straight, like the sides of a mule's foot, *the sole in front of the point of the frog is an inch and three-eighths thick.*

Recent investigations have established the conclusion that the growth and thickness of the sole are directly dependent upon the encroachments or relaxations of the wall. For instance, if the wall bulges out in front from the coronet to the center, and then turns in toward the ground surface, the sole will grow to an enormous thickness. If this bulge is excessive, the sole will grow so thick as to force the coffin bone upward, out of its position in the horny box. When the smith, to relieve this painful pressure, begins to hollow out the sole from the anterior point of one bar around the forward arch of the sole up to the anterior point of the other bar, he will be surprised to find how deep this scooping-out process of hard, unyielding sole can be carried out without touching the sensitive sole, or causing the flow of blood. Indeed, in extreme cases, it appears, to the operator, that there is no limit to the upward growth of the unnatural sole, and that there is no blood left in the hoof to be extravasated. The crowding inward of the wall in front simply doubles up the upward growth of the sole anterior to the point of the frog. When the wall in front is natural in its growth, and the quarters contract, either one or both, the sole invariably thickens and fails to exfoliate on the side of the shrunken quarters.

In all such instances the sole becomes unusually concave and arches above any possible contact with the ground.

On the contrary, when the wall is sunken in front, when induced by founder, laminitis, or flat foot, or simply by an abnormal growth, produced by unscientific shoeing, the sole, anterior to the point of the frog, becomes flattened and thinner than the proper strength of the foot demands. The treatment in all such cases involves the reduction of the wall in front, by foreshortening, and the elevation of the heel which has become abnormally low, while in the former class of cases the sole is to be hollowed out in front, but not posterior to the center of the quarters, the wall reduced at the toes, on the ground surface, and the heels to be lowered. These operations carefully repeated through two or three successive dressings of the feet will bring the sole into its normal thickness and growth. When the sole is thus brought into its relative thickness with reference to the wall, bars and frog, these two eminent teachers of farriery are directly at variance with reference to the offices of the sole as a weight bearer.

Professor Gamgee frequently endorses and elaborates the statement made by the English farrier, Mr. Moorcraft, in his work issued in 1800. That "the sole "ties the lower edges of the crust to-"gether, and by its upper part forming "a strong arch, it affords a firm basis to "the bone of the foot." While Mr. Fleming, on page 22, of his "Premium Essay on Horse-Shoeing" apparently leans to this theory in these words: "The "horn of the sole is less dense and re-"sisting than the wall, *and is designed* "*more to support weight than to sustain* "*wear*," yet, on page 28, he practically

Digitized by Google

repudiates this theory. "But it must be "noted," he concludes, "that the pres- "sure of the lower face of the pedal "bone on the upper surface of the sole "can never be very great, else the sensi- "tive membrane between them would be "seriously injured. This injury is pre- "vented by the coronary, and to a less "extent by the plantar cushion which "largely retards the descent of the bone "on the floor of the horny box."

Professor Gamgee nowhere elaborates his conclusions as to the weight-bearing functions of the sole, but frequently indicates in his laborious treatise, that the column of support, terminating in the pedal bone, finds a firm resting-place upon the overarching surface of the horny sole.

Thus, after more than a century of careful investigation by the eminent English veterinary surgeons, it is astounding that these two leading authorities are disputing over this second fundamental enquiry—whether the sole as well as the frog has a place among the primary weight-bearing portions of the hoof.

Manifestly the correct determination of this question is of the gravest importance. Unless it is accurately ascertained what proportion of the weight, if any, the sole and the frog bear in a properly shaped foot, no correct or satisfactory instructions can be given to the farrier how to pare the hoof, or to forge the shoe with reference to the proper bearings which have a constant influence upon both the perfect articulation and the healthful conservation of the hoof and its internal structure. The force of this observation is still more apparent when reference is made to their conflicting positions on the best method of shaping the foot with reference to its normal growth.

Professor Gamgee declares: "*The "object to be secured in paring the foot "is to secure the greatest fullness, or "breadth across the center of the bottom "of the foot;*" while Mr. Fleming contends the frog should come directly upon the ground at every footfall, so as to produce that width at the heels, upon which the health and strength of the hoof, and the full and free articulation of the internal structure depends.

The greatest fullness across the center of the bottom of the foot is not always to be desired, for the flat foot is full at this point, to the extent of physiological weakness. Nor is the widely extended heel to be cultivated beyond the limit of strength; for when the heels are spread so widely that the pressure of the footfall expands them beyond the limit of healthful action, inflammation and pain may result sufficient to produce lameness that is generally attributed to some occult cause beyond the diagnosis of veterinary science.

The bars thus seem to play no important part in bearing weight, so far as is revealed in their instructions; and yet they are as strong as the thickest part of the wall, as well as being not only of precisely the same substance but an elongation of the wall.

In farriery, object lessons are of immensely more practical importance than speculative theories. The living healthful hoof of the active colt of the temperate zone, roaming upon an upland pasture, thus insured against the undue contraction of dry mountainous regions, or the weak expansion of marshy swamps, is a better teacher to an observant student of equine physiology and anatomy than all the tomes ever written upon this exceedingly complicated specialty. Now take such a hoof that has never been misshapen by knife or rasp, and lift it up for inspection. The wall, all the way around, from heel to heel, grows down lower than the sole. At the quarters the bearing seems to be relieved, for the wall grows down lower at the heels and the toes than at the quarters. The reason of this relief is apparent upon investigation.

The wall is thinnest at the quarters, directly opposite to the wings of the coffin bone, where the greatest elasticity of the hoof is required to permit of the free ascent and descent of the coffin bone in violent action. Nowhere does the sole grow down to the level of the wall, except where the deflection of the bars at the heels requires this solid union of sole, bars and wall. The bars grow down to the level of the wall, and the strongest part of the ground surface of

Digitized by Google

the hoof is the heel formed by the wall, bars and sole. The alternate contraction and expansion of the flexor and extensor muscles require for the articulation of the foot that the heel should land upon the ground first, that it should then revolve over the quarters, that bear no primary pressure, and then spring from the toes, which grow to a strength and thickness only secondary to that already noted at the heels. The bars are unusually strong, and bedded into the sole, at the heels, where it grows the deepest, to add still more to their resisting capacity. The obvious use of the angle, at the heels, formed by the wall and bar projecting lower than the sole, is to serve as a check to prevent slipping either in walking, speeding or a sudden change of direction; for instance: The horse, bare-footed, rarely falls, no matter how slippery the ground or sudden his whirling movements. Moreover when these violent moods of speed animate the colt, in the pasture, the footprints show how deeply the heels are implanted in the ground to prevent slipping. The angle formed by the wall and bar thus gives perfect security. There is no sole imprint, only that of the wall and bar at the heel, which is deep. The frog shows less indentation, the quarters indicate still less, and the toes only second in degree to that of the heels.

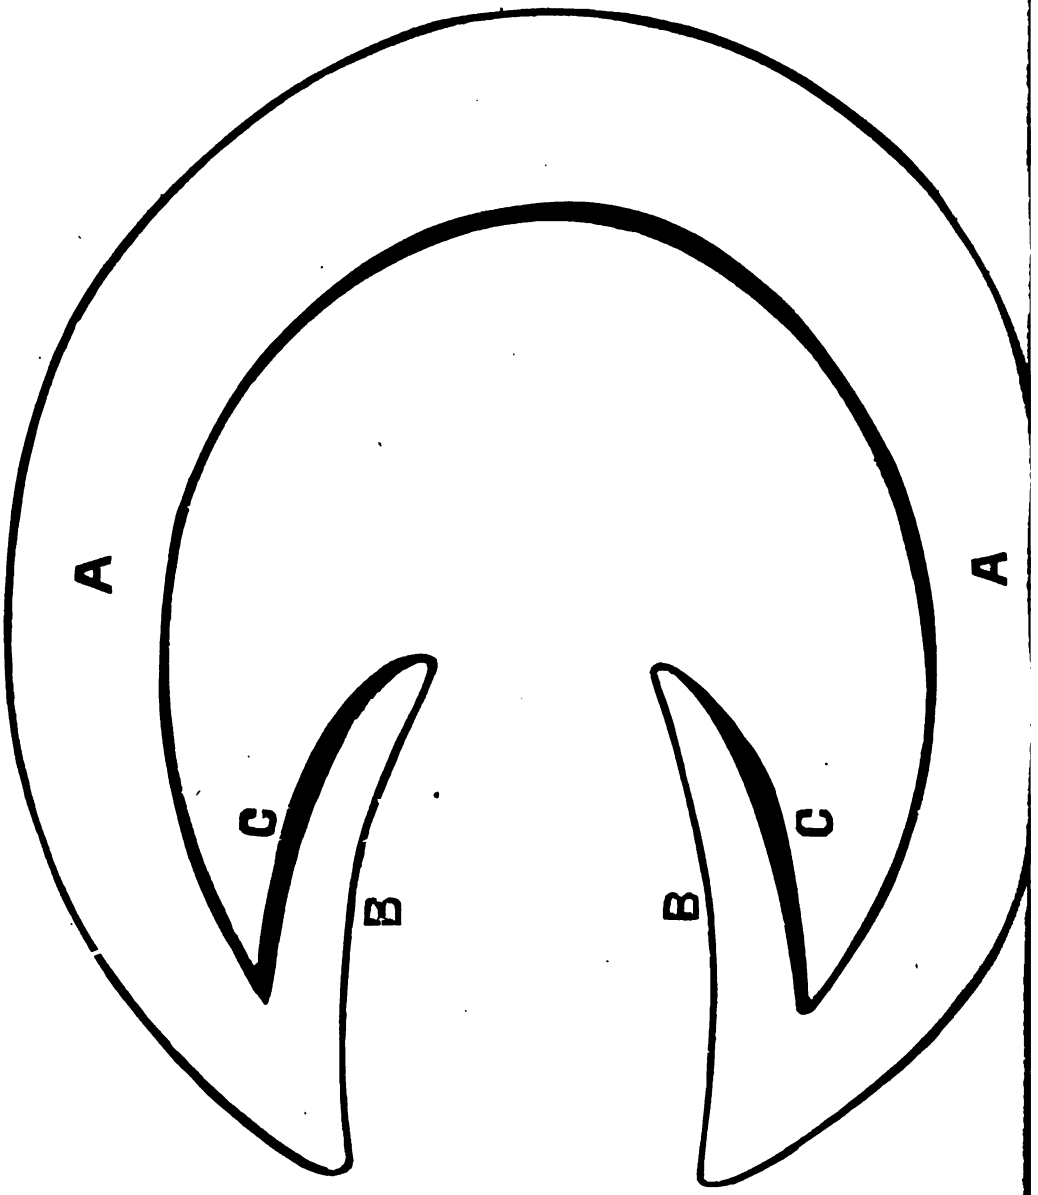
The impression of the two pairs of feet is essentially different. The front feet revolve much more than the hind ones. The imprint proves this fact; for the series of impressions of the heels, then the obliteration at the quarters, and the fainter mold from the frog. And the increased indentation from the toes, in the front feet, is measurably the same but more confused in the hind footfalls. The hind foot evidently works closer to the ground, its base of action, than does the front foot. There is, therefore, less energy in the revolution. Although the heels land first, there is less depth in the rear impression. The entire hoof seems to work more flat-footed. An excess of articulation behind would prevent the maximum of propelling leverage; and anything which retards that, injuriously affects the main propelling power. But the direction of the bars are valuable indices of the proper shape of the hoofs.

When the bars point sharply inward, the hoof is invariably contracted. When the anterior extremities of the bars point outwardly, as they always do in the excessively expanded flat foot, the hoof is abnormally wide. When the bars are precisely parallel with the line of the commissures, then the hoof is neither expanded nor contracted, but of precisely the normal size. The fulness at the quarters is just enough to admit of the easy and natural descent of the wings of the coffin bone, without the least possible interference with the wall, thus preventing side bones, or ossified cartileges. The heels are precisely of the requisite width, thus preventing what always happens when the wall is too upright—an excess of resultant concussion from ascending into the sensitive regions of the navicular bone; or what always happens when the wall is unduly expanded—an undue strain upon the flexor tendon in its downward sweep; or an injurious strain upon the sensitive laminæ of the heels, already unduly expanded, are forced beyond their capacity when the weak heels are thus forces wide apart. The finer face of the smith'd rasp can now be brought into requisition to establish most invaluable conclusions.

If placed across the rear portion of the hoof, from heel to heel, *it will be found in the normal foot not to touch the frog*, but to show a space at least from one-eighth to one-sixteenth of an inch. The rasp can be placed in any position across the bottom of the foot—either transversely from the heel to the toe, or across the center, at the fulness of the quarters, and in no instance will the sole come in contact with its face, for the center of the sole not only arches up beyond this bearing, but the wall grows down below the line of union of the sole with the wall. The only portions of the lower border of the hoof that will touch the rasp will be the wall and the bars. These then are the primary weight bearers. If the wall is dressed to a level, the heels are rasped to the proper height, the toes trimmed to the normal length, and the bearing is placed upon

Digitized by Google

the wall and bars, with a slight relief at the quarters, the foot will never expand or contract beyond its healthful limits. Unless some severe strain, or sole bruise, or external accident, against which no pre-



caution avails, the foot will retain the full rounded outlines of colthood, and ltmeness will never result from this treatment.

Now the proof that the bars are not only *the binders*, as the old farriers of English literature termed them, but *the expanders* of the feet, is not beyond the limits of practical demonstration. The direction of the bars as hereinbefore indicated is the certain physiological proof. The actual test is the application of a shoe that will concentrate the bearing upon the wall and bars. This is found in the pattern herewith presented, (*see illustration*) designed by the author. ex-

hibited by Professor Russell as the centennial shoe, in the international exposition at Philadelphia in 1876.

The hoof is carefully dressed, so that the shoe rests exclusively upon the margin of the wall and the bars, with no pressure upon the sole, and the frog in slight relief. After the shoe has been worn a month, the plates resting upon the bars will prove to be unerring indices of the condition of the foot. If it is contracted, the plates will careen outwardly, that is the inner edge B will be higher than the outer edge C. If, on the contrary, the hoof is already too much expanded, the wings will reverse their inclination, showing the tendency of the bars to restrict the undue expansion of the heels. But if the hoof is normal, in shape, and neither too broad nor too narrow, the plates will remain as true and level as the web of the shoe. Since the beginning of farriery the contention has never ceased whether or not the frog exercises an active agency in expanding the shrunken hoof. The proof that it does has always been the barefooted test. No matter how aged the horse may be, or how contracted may be his feet, if his toes are fore-shortened, the heels are lowered, and the commissures are cut down thin, all around the frog, with the nose of the drawing knife, so much so, that the frog can be moved with the fingers from side to side, as it can be moved in the colt's foot, and the horse is then turned out for an entire season in a moist pasture, the feet will again approximate to the full rounded outline that they enjoyed before knife or rasp or shoe were applied to them. But the conclusion that the frog has been the active agency in promoting this expansion is erroneous; for, if the foot is uplifted and the rasp is placed across the bottom from heel to heel, it will be found that the frog does not touch its face. If then the frog is not thus a primary weight bearer, how can it exert so powerful an agency as that of expanding the solid, unyielding, shrunken wall? The opponents of direct frog pressure have interposed an objection to its effective capacity as a hoof expander that has never been satisfactorily met. The wall is hard, firm, dense and aggressive. The frog is soft, yielding and naturally receding. How then can the soft frog expand the hard wall, any more readily than a piece of new cheese can split or force open a block of wood?

The only answer has been that the great pressure of the superincumbent weight is sufficient to compress the soft frog into a compass dense enough to force outward the firm wall. But the still more insuperable condition that the frog does not come down primarily upon the ground, prevents that compression necessary to expand the wall.

Ever since the wall of the hoof has been imprisoned by the iron clamps called horseshoes, the great problem has been to prevent the contracting tendency of the iron. This word is used in the popular sense, for it matters little whether the wall contracts against the sensitive portions of the foot, as the farrier contends, or the sensitive parts first suffer a diminution of substance, called waste or atrophy, as the veterinarian insists. The shrinkage is present after shoes are nailed to the foot, and that shrinkage is not only attended with a diminished vitality, but a consequent loss of elasticity, which is the active means of dissipating the concussion of rapid action. The devices for preserving the normal elasticity of the hoof have strained the mechanical ingenuity of farriers since shoeing has been established.

The hinged shoe of Bracy Clark, the unilateral nailed shoe of Turner, the periplantar shoe of Chartier, the thin-heeled shoe of Coleman, and the tips or half shoes of La Fosse, terminating at the quarters, and leaving the heels bare, have all been devised, used, and finally discontinued, because all of them have certain defects and inconveniences that have destroyed their permanent popularity. The hinged shoe of Bracy Clark for instance, has the hinge at the toe, where the foot is designed to be the most solid; the unilateral shoe of Turner concentrates the bearing chiefly where the nails are fastened on the one side, and leaves so much purchase that the nails tear out of the wall, making it ragged

Digitized by Google

and broken; the periplantar shoe is too light and too difficult of construction and placement to become popular, leaving the sole to bear too much pressure, while tips are exceptional in their benefits when great speed is demanded, for unless the hoof is exceedingly strong, they will produce soreness.

One and all have their objectionable features, so much so, that they do not long hold their sway, but like fashions in dress, come and go, with certain waves of the public fancy.

The evidence that all of these methods have been found wanting is the substitution of the latest fad—the insertion of steel springs in the bottom of the foot, fastened under the shoe, and fashioned so that the posterior ends force out the heels at every footfall. But this mechanical contrivance is plainly an act of violence, without any limit, with reference to the normal expansion of the hoof. Then, again, when these springs become loosened, they are exceedingly dangerous. They have been known to penetrate the sole like a nail and cause serious lameness.

Some device should be constructed that will enable the hoof to preserve its own expansion, as it does in the unshod state, without being made to widen too far, or too little, as must be the influence of all purely mechanical appliances. If the wing-heeled centennial shoe places the bearing where it is concentrated on the lower surface of the unshod hoof, then it answers all the requirements of the weight-bearing portions of the foot. The only satisfactory proof of this position is the beautiful shape of the hoof, after it has been furnished with this pattern. It never contracts. It never becomes sore. It never is afflicted with heel bruises called corns, when the hoof is pared to its normal proportions, and is properly balanced.

No expert horseman has ever been disappointed in their use. Theory apart, practice has demonstrated their value. Upon the application of pressure to the bars, acting as far as possible independently of the web of the shoe, bearing upon the wall, will the perfected horseshoe of the future be made.

The author designs to embrace the papers enclosed in this series, with others not yet prepared, in a separate volume, and the concluding numbers will not appear at present. S. T. H.

PROBLEMS IN BREEDING.

BY A. H.

Heredity.

III.—TEST.

The Problem Stated.—According to the theories of heredity presented, and which are now undergoing the crucial trial or struggle for the survival of the fittest, we have already indicated that judgment is called for—rests—on the basis of heredity of "acquired characters," whether they originate in the soma (body) independently of the germ-plasms or in the latter independently of the former.

There are characters which are evidently born with or in the individual. These are called congenital. Here, as in the other case, we must also consider if such originated without the aid of outside influences.

Other characters, apparently to the observer, appear for the first time in the experience of the individual, *i. e.*, after the closing up of the fertilized ovum, on the fusion of the two sex elements. But, as they are not seen by the conscious observer till after birth, generally it is then that individual existence is understood to commence. In the first period, from fusion till birth, the individual is entirely dependent; in the second (partly or entirely) independent.

Thus it might be possible for some characters to appear in the *individual* (embryo) during its entirely dependent period—the status of which has to be clearly appreciated. It is during this period, for instance, that certain hereditary "malformations" take definite form. We have, therefore, to consider the rela-

Digitized by Google

tions of these, also, to other classes of characters—whence the stimulus proceeded, from without or within. Though really appearing during individual life, as they do so before birth, they are included under the division of congenital characters. Further, there is another class of characters that are undoubtedly *born* with or in the individual, which, however, do not appear till later in life. These are generally such characters as come under the title or classification of hereditary diseases.

Cases of monstrosities and monsters involve entirely different considerations to those included in the present summary.

There is no doubt, it is admitted, that new characters originate by the continually evolving variations of the germ-plasms. This is the explanation of born or congenital characters. New characters may also originate in the life history of the individual. These have been called acquired characters. *Queries:* Can congenital characters be traced out of the germ-plasms to ones originating for the first time as the result of some external influence on the body (soma)? Can such characters as the latter really be traceable into the germ-plasm, as primarily arising therein? These are the questions suggested by the particular problem that is being sought to be solved.

As both sets of characters are—and here mental confusion has ruinously reigned—and can be called, *acquired*—because they are, generally, in addition to what existed before—we have to be careful in understanding what we are at—proving or disproving. For the further question (besides whether the one set can be traced as being derived from influences outside of what—plasm *or* soma—gave it apparent origin and *vice versa*) is: Are they equally transmissible. hereditarily? Can congenital (plasm) characters reach out to and influence the future somas? Can acquired (soma) characters reach into and influence future plasms? Here the two lines of investigation come to a parallel.

But, on further examination, we find on one road a terminus. It is only on the other wherein there is still more investigation to be carried out. For both sides admit, in regard to the transmissibility of congenital characters, the affirmative; but in regard to individual characters, there is, as indicated, a radical difference of opinion. The "old" school asserts the affirmative, the "new" asserts the negative. Therefore here is the point—the crux.

It is upon the explanation given by each school to their contentions that each seeks to prove satisfactorily the *best* how of evolution—which includes, involves, the principles on which depend the improvement and development of our domestic breeds of animals, as well as the destiny of the human race itself.

The Problem Illustrated.—As we are dealing with the acceptability or non-acceptability of Weismann's theory, we shall here give an example from his point of view, which will contrast strongly with the views entirely, it may be said, held on the same subject by former writers on the origin of species, varieties and characters:

Notwithstanding the number of generations of horses which may have used their limb and lung for acquiring individual speed, notwithstanding the degree of increased powers of muscularity, endurance or speed that may thus have been acquired or secured by each individual generation of such horses, as a consequence of such individual exercise or training—all this individual improvement, made in such a way in such different generations of such race of horses, has had no effect whatever on that portion of the individual (the germ-plasm) handed on or transmitted to the next generation. All this effort and effect has been effort and effect effectually thrown away—in so far as any idea or purpose of its being advantageous or beneficial to the next generation in starting it with enhanced powers or possibilities in these respects is concerned.

This means that each subsequent generation of horses has to begin all over again, and where its parents began—with no greater benefit bequeathed to such generation by the developed action of their immediate ancestors than if those ancestors had been the veriest plugs rescued from the knacker's yard.

This, on the face of it, seems a too ut-

Digitized by Google

terly insane predicament for any one to attempt to extricate himself. For instance, where would Nancy Hanks have been but for the training that acquired speed for her in her ancestors?

The above is the view of Weismannism, seen by those of unperceiving, unbelieving eyes.

The following is how the believers in the new theory see it:

Among all the infinite number of variations, that are possible congenitally, and are in fact necessarily so continually occurring in each generation of horses, some of these will relate to one or more particular tendency or another toward more perfect bone or muscularity, greater endurance, lung and head power, etc.; which in combination with others similarly tending, will produce an hereditary concentration of such tendencies, to the exclusion of such as proved themselves ineffective or inefficient in such respect, and will produce an "individual" similarly proved or constituted.

These variations in the germ-plasms have occurred without any external influence directing the complicated process of their final molecular arrangement; but simply by the very simple and ever forceful power of successive combinations of the more and more concentrated plasms. Those that are so best constituted will prove best in act.

Let us see how it is in the wider field of nature. If the race of horses so happens to be situated in a locality or under conditions wherein greater speed, etc., would be a certain advantage to the perpetuation of the race, whenever such variations occur, possibly in different individuals at different times, each and all of such variations will be *favored by natural selection, i.e.* preserved. These being congenital variations will therefore be perpetuated by heredity. Subsequently, similar variations, having occurred in other individuals, or occurring in the future in others, these being so distinguished from their neighbors, and benefited by natural selection, are most naturally attracted, like to like, to each other. These variations thus added to each other will be still further aided in the same manner by natural selection in increasing the advantage to the race thus already secured. Natural selection thus collects, adds and aids in the work of picking out and thus preserving, in the germ-plasms of all so naturally selected, character variations tending to produce the advantage required—greater speed. These selected tendencies going on for generation after generation, more and more of such new ancestral characters are being accumulated in the germ-plasms and becoming emphasized in concentrated constitution, and that too the more from the elimination or cessation of mixture with the no-speed-producing plasms, and so in perpetuity.

Hence each generation is endowed *naturally and therefore permanently* with greater powers of speed. The stability of the beneficial variation fixes the new racial characteristics. The new race presents new characters of improved function, producing an exhibition of good "form"—literally as well as figuratively.

The Giraffe's Neck From the Two Standpoints.—The above is a rather elaborate, labored explanation of the process believed in by the new school, but it may become more clear as we proceed. Perhaps the following, put tersely and concisely, will accentuate the radical difference in standpoints of the rival theories. It is the case of the giraffe's neck, the most common Lamarkian example. It is supposed that, according to the theory mentioned, a continual stretching of the neck to reach the high foliage was the cause of the lengthening. But it seems to the new Darwinian idea much more reasonable—and therefore the better explanation—to believe that the reaching the tree-tops was a result of the congenital tendency (of the germ-plasm) to produce generations with longer necks—by the process of natural selection. Instead of stretching preceeding the lengthening it was *vice versa.* The former was an external "influence;" the latter an internal (germ-plasm) tendency. The greater reasonableness of one of these over the other rests with most impartial minds to decide. Our own preference will soon manifestly appear.

Illustrations in Which Selection and Use Alone Respectively Operate.—We find that Alfred Russell Wallace has

Digitized by Google

also used the horse in contrasting the two theories which are in antagonism (*Fortnightly Review*, September, 1884): "In order to make the difference between the two theories clear to those who may not have followed the recent discussions on the subject, an illustration may be useful. Let us suppose two persons each striving to produce two distinct types of horse—the cart-horse and the racer—from the wild prairie horses of America, and that one of them believes in the influence of food and training, and the other in selection. Each has a lot of a hundred horses to begin with, as nearly as possible alike in quality. The one who trusts to selection at once divides his horses into two lots, the one stronger and heavier, the other lighter and more active, and breeding from these, continually selects, for the parents of the succeeding generation, those which most nearly approach the two types required. In this way it is perfectly certain that in a comparatively short period—thirty or forty years perhaps—he would be able to produce two very distinct forms, the one a very fair race horse, the other an equally good specimen of a cart horse; and he could do this without subjecting the two strains to any difference of food or training, since it *is* by selection alone that our various breeds of domestic animals have in most cases been produced.

"On the other hand, the person who undertook to produce similar results by food and training alone, without allowing selection to have any part in the process, would have to act in a very different manner. He would first divide his horses into two lots, as nearly as possible identical in all points, and thereafter subject the one lot to daily exercise in drawing loads at a slow pace, the other lot to equally constant exercise in running, and he might also supply them with different kinds of food, if he thought it calculated to aid in producing the required effect. In each successive generation he must make no selection of the swiftest or the strongest, but must either keep the whole progeny of each lot, or carefully choose an average sample of each to be again subjected to the same discipline. It is quite certain that the very different kinds of exercise would have some effect on the individuals so trained, enlarging and strengthening a different set of muscles in each, and if this effect were transmitted to the offspring, then there ought to be in this case also a steady advance toward the racer and the cart-horse type. Such an experiment has, however, never been tried, and we can not therefore say positively what would be the result, but those who accept the theory of the non-heredity of acquired characters would predict with confidence that after thirty or forty generations of training without selection, the last two lots of colts would have made little or no advance toward the two types required, but would be practically indistinguishable."

The above appears to us to invite remark. Taking the first illustration, Mr. Wallace says he could develop a race horse or a cart horse "without subjecting the two strains to any difference of food or training;" all that he would have to do would be to select those of each class "for the parents of the succeeding generation those which most nearly approach the two types required." But pray, how was he to know which of each class of each generation were of the proper type to pair? Of course type (form), *in this case*, is produced irrespectively of test. For, as *selection* alone is permissible, the breeder is forbidden to take advantage of the evidences of ability or inability *to act*, of the, theoretically alone, requisite type. Practically, in this illustration, he is restrained from using them for such purpose, or seeing their own performances in the field. In fact, in this instance, *exercise* is not allowed at all in the racer or the tracer, as *selection* is not allowed in the second instance. There can be no *selection* without some test. Selection itself has never, can never, originate the condition for testing fitness for survival. As we shall attempt, herein, in every instance to show, *test* is what selects.

Wallace's illustration may be all very well for form, but what of the force—speed?

As the germ-plasm is, besides, in this instance, theoretically the same at the start, or approximately the same, each generation ought simply to reproduce an

Digitized by Google

average of the foundation parents—there ought to be no tops or tails—in form, the only guide the breeder is allowed. We know what that form has been for generations believed to correctly be in the horse, to which form-breeders have indeed committed themselves; and we see that in practice, even with training, breeding to type alone is erroneous. But we know an average is impossible. This means that each generation is not born equal.

Training a Test.—It is not type, but test; it is not conformation, but performance; it is the training—the finding out the *force* of each successive *form*—each successive form's force—that is the only criterion or test for selection. *No force—no form*, is, tersely, the text of *our* test. Weed out the forms without the force. The best form, constitution, etc., is that which is credited with the best performances. There can be no *selection*, in this instance without performance, no performance without test, no test without trying, trying, trying—which is otherwise simply *training*. To make our meaning and reasoning even clearer, we may further insist that training can only develop, improve, discover *that force which is within;* it can not impart, instill, implant something within, that does not exist externally; but further, nothing can exist externally that does not come from within. Training is the taking out, not the putting in. It is the taking from, not the adding to. It is the inherent force within, not the apparent form without, that it develops. The force is from within (inherent), not without (acquired).

The trainer himself, we submit, will endorse this. Hence is seen the absolute importance still of training. Without it the breeder can not discover those animals possessing the inherent gift of speed he is in search of. By this means, only, is he enabled to discover the animal's gifts he wants to preserve and perpetuate by mating. Training is essential to making the horse's calling and selection sure.

Selection and Test Must go Hand in Hand.—In the second illustration Mr. Wallace inadvertently forgets that those who rely on acquirement of qualities by external use, *alone*, no less insist on the power of transmission possessed by said characters. In both cases it is evidently impossible to suppose that the animals chosen for the experiment in the first place were equal. If they were, in this second case with equal use, food, etc., the breed would, at the end of the experiment, if it could be conducted in such a way in total regard and consonance with the theory of it, be measurably, but no one could believe that they would be all *equally*, improved. The influence that had brought it to this pitch, to maintain it would have to be constantly, for ever, exactly meted out. Remove the means used for improving the certain qualities and the breed would deteriorate or revert to its former condition—which would be worse than the first—according to the theory. But where, in this theory, then, does the insistence of the force of heredity we have mentioned apply? As we understand it, this theory, in its insistence on the hereditary transmission of the effects of exercise of function—by exertion, feeding, etc., assumes *not* so much that these effects will remain, after they are apparently transmitted, if their alleged causes are removed, *but* that the transmission implies the handing on of characters able to take increased advantage of the increased provision of exertion, feeding, etc., producing them. We need not discuss this here, though we may say that, with our increased enlightenment or insight, it seems to us that this will not stand the test of argument. But let us return from this digression.

"No selection is needed" in this second illustration. We know that in practice no such method would ever be attempted by the advocates of the effect of use and disuse. They would *at once select* those in which exertion and feeding had developed a good racer or tracer. They would sacrifice the sluggish and pithless. Here, at once, they march into the camp of their opponents. This proves that use only is good in certain cases—those *naturally* able to stand the test. From hence, if the process is persevered in, it is entirely by that of selection indicated by a common test. In these cases selection and test (training) must

Digitized by Google

always be identified with one another—the test proves fitness for selection.

The Above, Therefore, Suggests a New Lead.—"'Tis deeds must win the prize"—in nature as in domestication and civilization. In nature no such sedentary selection as indicated in Mr. Wallace's illustrations would ever take place—however much it is in vogue in society. In fact it begins to appear to us that the "acquired-character" men have got their cart before the horse. They mistake the *test* of selection for the cause.

The more we think over the possible development of any such experiment made to prove the Lamarkian belief, the more are we convinced of its futility for that purpose—its worthlessness in fact. For it can not precede a step before it involves the evident operation of the forces asserted by the new Darwinists.

The reader will have begun to be impressed with the fact that we are dealing by no means gently with the old ideas held on the important matters being discussed; that, in fact, we are exhibiting pronounced symptoms of Weismannia. Such is, in reality, the case. Hence this remarkable condition in which we find ourselves may be supposed to require some allusion.

For one whose life has been passed in the observation and breeding of domestic animals, the conclusions we have come to may seem to be the rankest of treason. In our "treason" we are idol smashers, that is, we deny to the creators of all our wonderful breeds any personal influence in directing or molding these breeds; we deny the value of all the science of nutritive ratios, perfect training, education. In fact, it will be said, we deny that man can with the external means at his command either improve the breeds he is dependent on, or the race to which he himself belongs. It will be said we are thus driven to preach "the gospel of despair"—that all the grand results of time—in civilization, education, culture, morals—have had, and can never have any influence whatever in effecting any possible elevation of the race; and a great deal more of the same kind of "calamity howling" may be attributed to us.

Our answer may be found in our treatment, hence, of this subject. The one thing needful to convince, to confirm our view, that was so long lacking or had not dawned on the understanding, arose under the most ordinary circumstances attending the every-day occurrence of struggling through and amid Chicago's hustling thousands. That one thing needful to effect the transfer of acceptance from the old to the new was the result of obtaining a simple difference of view in regard to the relation of (what was formerly considered as involving the source of hereditary characters, viz.) *test* to selection.

Our treatment of the subject has therefore been from the standpoint we take of what we shall develop as this new idea of *test* in relation to selection and evolution. It will at least be seen how this view or idea may aided in dispersing the mental haze or confusion that each side asserts surrounds the expository understanding of the other contending theory. It certainly confirms a conviction that the old school has mistaken a *method* that indicated fitness for selection, for a *cause* of result; also, that what in many cases the new school deny as a cause may be regarded as simply an indicator of external fitness to internal development. We disclaim egotism in the above specification. We disclaim any credit herein. What clue or flashlight that may reveal the truth to one mind, and hence one's faith therein, may not do so in another, though a different one may. Hence we simply hope this allusion may encourage others to discover other light; if what has satisfied one is not enough for them to find their way out of (what we can find no other term for) the turgid darkness of a superstition.

We do not claim to be able to effect such a mental revolution, though we feel it is quite possible for abilities, comprehensively equivalent to the task, to do so. But we shall not, any whit the less fearlessly, shrink from doing the best that in us lies to illustrate the idea that has helped to confirm one mind in a new view of an all-time problem, though far from possessing an angel's tread.

We do so also because we find no

Digitized by Google

"despair" in so far as animal improvement is concerned, in the new doctrine. Indeed we find ourselves regarding it with very opposite feelings, as more truly than we were ever able to do before indicating means—founded on that nature that is still building for aye—of effecting the purpose of developing races to the very highest pitch of perfection,

Arranging the Tests to be Considered.—It is rather curious, in connection with this investigation in fact, however, necessarily so from the previous history of the problem, that "acquired" characters—both blastogenetic (congenital), or somatogenetic (individual)—when we come to systematize them, directly presume the influence of external influences. This is only, however, for convenience of arrangement the more easily to attack them severally in the implied assumption—the point disputed and which regards them as the *cause* and not a simple methodical *test* of fitness. But we are not only exhibiting to the judgment of common-sense Weismannian tenets, but also Lamarkian tenability. Therefore, in presenting the principles on which are founded the denial of the transmissibility of individually acquired characters, we will arrange these according to the Lamarkian assumption. The "bill" which follows seems a pretty stiff one to discuss. It seems tolerably complete. Such an arrangement can not be made perfectly definite in each part, for certain characters may be able to come under more heads than one. For instance, the cases of blind-worms, moles, cave-animals, etc., might be considered under *environment* as well as *function*.

We had no idea till the attempt was made that there could be so many conditions of tests made. This means that we had no previous idea of the necessity of discussing so many different examples. But as the great lexicographer declared that a copious vocabulary was a preventive of verbosity. so we may permit ourselves to believe that a thorough classification is conducive to certainty of conclusion.

These characters must not only be considered in connection with nature, but also domestication, and its climax (in regard specially to man), civilization. They involve, besides natural and artificial influences in nature and domestication. The classification is not presented as a perfect summary, but one that may be useful in carrying us pretty completely over the ground to be traveled.

Professor Eimer, a leading opponent of Weismann, thus defines "acquired" characters from the anti-Weismann point of view: "Every character which must have been formed through the action of the organism is an acquired character. All characters which have been developed by exertion are acquired, and these characters are inherited from generation to generation. The same holds for all organs atrophied through disuse—the degree of atrophy is acquired and inherited. In the first class we see especially the action of direct adaptation, in the second the results of the cessation of this action. A third class of acquired characters are to be traced simply to the immediate action of the environment on the organism and originally, at the commencement of their appearance, all characters must have belonged to this class."

We may now give a tabular arrangement of

CONDITIONS UNDER WHICH ACQUIRED CHARACTERS ARISE.

I. ENVIRONMENT.

a—Climate, soil, etc.
b—Nutrition, food, etc.

II. TRAINING (FUNCTION).

1. BODILY.

a—Use and disuse of parts—increase or decrease of function.

2. MENTALLY.

b—Up-bringing, education, etc.

} *Imparted* or *derived.*

III. HABITS.

a—Personal—*original.*
b—Racial—*instinctive.*

IV. MUTILATION OR INJURY.

a—Natural.
b—Artificial.

V. DISEASE.

a—Contractible.
b—Uncontractible.

} *Heritable* or *immune.*

VI. PROCREATION.

a—Mental impressions.
b—Previous impregnations.
c—Sexual characters.

ENVIRONMENT.

In treating of environment we have a most interesting subject, as it includes the consideration of naturalization and acclimatization of species and varieties.

Digitized by Google

Herein we must more strictly confine ourselves to the main point of the relation of the subject to special characters, though explanations illustrative of the special phases suggested may be also found.

It will be primarily of interest to see what views have been held in regard to environment by recognized authorities. The following quotation from the standard authority, Professor Packard, summarizes the belief, held generally up to the presentation of Weismann's theory:

Various Views.—"We know that species vary, that hardly any ten experts agree exactly as to the limitation of species; that varieties tend to break up into races, and that no two individuals of a race are exactly alike. Where the climate and soil remain the same, the species tends to remain fixed and stable. Remove the stability in the environment, or subject the individuals of a species to changes of soil and temperature, and expose it more than usual to the attacks of its natural enemies, it then begins to undergo a change. This is seen in those individuals of a species which live on the borders of lowlands and highlands, of deserts and fertile tracts, of salt and brackish water, of shallow and deep water or to the influence of alternating cold and warm weather. Where, as in some cases, climatic or other agencies suddenly change, we may have species and even genera suddenly appearing as is known to be the case in the water—such as changes from brackish to briny—as worked out by Schmankevitch in Russia." ("Zoology," p. 673.) A different view is now being taken of the source of these "effects," more naturally in accord with the simple theory of Darwinian evolution, and from a standpoint we shall indicate.

Professor Eimer is also positive of the effect of environment:

"The tropical climate, however, certainly exercised, sometimes in a very short time, a direct influence on particular characters of animals, especially on the integuments, on the thickness of the coat of hair, on the nature of the wool, etc. This is demonstrated by authoritative writers." (Eimer, p. 101.) Also, he says: "The acquired characters depending on nutrition in our domestic animals are so well known and so obvious that nothing need be further said about this." (p. 103.) Yet the denial of all this was *independently worked out a century ago* by an as yet unrecognized anticipator of the modern views, Dr. Anderson. This philosopher's views were too advanced to receive contemporary indorsement apparently, hence have had no historical reference, to-day, in critiques of the new theory. The quotations we shall make further on from Anderson's writings will no doubt astonish the present contenders. We give here several isolated passages as examples:

"All the qualities which serve to distinguish particular breeds of animals from one another, can, in some cases, be transmitted without alteration to their posterity, forever, *if they are carefully kept from copulating with other breeds of the same kind.*" This, he says, is fully demonstrated in common experience, though not properly appreciated.

"When a variation occurred it was attributed to climate, food, etc., and *not to the nature of the breed.*"

"A variation, with regard to the climate, therefore, produces only a temporary change upon the fineness of the wool of that individual sheep, which is immediately exposed to its influence. But the difference in this respect that arises from a *variation of the breed* of sheep, *is of a more permanent and invariable nature*, as any two sheep, originally of different breeds, not only retain the same difference between one another, if they are at the same time carried through any diversity of climates, but their descendants also retain, at all times, if in equal circumstances the same difference that was observed to take place at first. Although warmth of climate invariably tends to make wool that grows upon any sheep coarser than it would have been upon the same sheep if it had been in a colder climate, *yet this has no influence on altering the nature of its progeny*, nor even of producing any change upon the animal itself, longer than it is immediately under the influence of that heat."

"Are the varieties that we perceive, in this respect, to be attributed to acci-

Digitized by Google

dental causes (such as climate, soil, food, etc.) alone, and not immediately depending upon the nature of the parent animal?" This remarkable (for the time in which it was propounded) query he answers by affirming the latter as the sole source of variety.

"We have seen," he further says, "that different varieties of the same species possess certain permanent and distinct peculiarities that can not be altered but by an admixture of blood. Those peculiarities that I have taken notice of, respect chiefly external circumstances, which are very obvious to the senses. There are other peculiarities, however, of a more obscure nature, which, though equally useful, are not so easily ascertained by sensible marks, but which are still easily recognized when you take two breeds that differ very much from each other. Of this nature is hardiness—or spirit, as contrasted with softness in horses. Also the flavor of the flesh, etc., of different breeds. There is a quality peculiar to every distinct breed of domestic animals which can only be changed by blood. I do not say that this can not be altered by the (external) circumstances stated, for I know that the alteration that may be produced by these means is always very great. What I mean is simply that under the same circumstances the qualities of the different breeds will be different." He proclaims *breed* as everything; this is simply the apotheosis of the germ-plasm.

Particular Cases Considered—Shetland Pony.—Perhaps no breed in existence could be taken to better test the matter of the influence of climate and food than the Shetland pony. This breed, according to Brand, who visited the island in the year 1700, was so small that "there are some whom an able man can lift in his arms, yet well they carry him and a woman behind him eight miles forward and as many back." He also says "the coldness of the air, the barrenness of the mountains on which they feed, and other hard usage may occasion them to keep so little, for if bigger horses be brought into the country their kind within a little while will degenerate." Mr. Brydon, commissioner to Lord Londonderry—the largest breeder of ponies in Britain, in a paper read to a meeting of the Glasgow Agricultural Discussion Society last March, remarks on the above thus: "This is probably correct, and we may surmise that the breed is a very old inhabitant of the islands which has gradually become adapted to its surroundings, and endowed with the strength and vitality it now possesses as the result of a constant struggle for existence. It is, in fact, an illustration of the survival of the fittest. The hardships and privations which accompanied the severe winters assisted to keep the breed pure by destroying weak and imported animals. The imported horses are always a larger animal, and had they been adapted for living on the scanty food the islands afforded, they might have done much harm, in altering the character of the breed, as the smaller and truer to type the ponies are, the better are they adapted for their life and surroundings. Another circumstance that helped to keep down the size was the practice, at one time generally adopted by the islanders, of selling their largest ponies. This was not done with the view of keeping down the size, but merely because there was no outside demand for the smaller ones." The above affords us food for thought.

Brand says *the conditions* made the breed so little; that in fact, give the breed more food, better climate and better care, it will increase in size. This is what is totally denied by the new school. In fact Brydon shows how this view is incorrect. He shows that, as continually as individuals appeared that were not adapted to the conditions in their particular constitution, these as quickly succumbed and their "blood" bred out of the general survival. The survivals, or those born that could rustle with the severe conditions of congenital stamina, bred to themselves. This is simply pure natural selection of suitable variations, presented by the germ-plasms, that produced a breed fitted to the conditions. Just indeed as a breed of fowls arose in certain western islands of Scotland from individuals that varied in that they were born *rumpless*. The rumpless character gave them an advantage over the tailed fowls, as they were not blown

Digitized by Google

about or off the island as the latter were. Hence the peculiar breed was perpetuated by heredity.

As to the bigger horses degenerating on introduction for the same reasons, we must remark with Dr. Anderson—whom we shall produce below—that this might arise, not from change of condition, but as resulting from breeding them with the natives; *or* from the simple occurrence of individual disarrangements caused by disagreement of climate interfering with function so that no produce was left. This is, we would wish to insist, an important factor whose significance will be pointed out more forcibly. It would be only by keeping the "large kind" pure—free from intercopulation or the swamping effects of intercrossing--that effects of change of environment could be tested. We must ever distinguish *the effect on the individual* of such change just alluded to as it relates to propagation. Such effects come under the category of the accidents which interfere with the continuity of the germ-plasm. This is simply the handmaiden of natural selection. Retransformation is not contemplated by that. So that what is not suitable to certain conditions is eliminated before propagation has a chance to assert itself.

As scanty keep and severe climate so weakened the larger imported animals, according to the old view, why did we not also have reduced strength along with all other reduction? And why, in the first instance, did not the severe climate sweep away the equine altogether from Shetland? The reverse was the case, showing the "adaptation" originated from within (the germ-plasms), not from without. The breed was the result of pure natural selection *alone.*

Again, it is told, the islanders *sold their largest* animals. Here they unconsciously, aided natural selection. *Then* there was no market for small Shelties; *now* there is no market for large. *Hence,* unless this is not taken "tent" of the breed will gradually get larger, and people will claim that it is the better keep and climate abroad that is causing increase of size, instead of recognizing the true reason as the result of varied selection merely.

To show how fallacious is the theory of effect of climate and food, Dr. Anderson, a century ago, said: "If animals be fat it is a proof that they have abundance of food, whatever be their size—though if they be thin, it is not a proof that they are in want of food. The Shetland pony is of a size as small as that of the island of Tiree; but the first is a plump strong-made animal that is almost continually fat; the last is a thin, puny creature, that looks always starved, though its native food is richer. In like manner the Alderney cow is a hard-boned, hungry, starved-like creature, when even on the best of grass. The Kyloe is not much bigger in stature, but it is a burly looking creature compared with the other, and has a tendency to fatten kindly wherever it has food enough. The first is the native of a fine climate and good soil; the last is found in an ungenial region and very unfertile country." And also "it is observable that the prevailing breed in any one district always continues of the same kind, so long as the inhabitants of that district continue to breed from them, whatever alterations they may make in the general culture of the country and nature of the pastures." Such views as these were doubtless heretical in the days which they were uttered or perhaps rather regarded as lunatical.

Lord Arthur Cecil, at the same meeting, after adverting to the fact of the hard conditions producing, not a hard looking, but an extraordinarily favorite breed said: "He knew for a fact that if the Shetlanders were bred and reared under more favorable conditions they grew bigger in size." This, no one will deny, may be possible to a certain extent, but it should be carefully noted, not to apply to a breed in posterity what refers only to the individual in particular. This is another source of confusion that has led to such omnipotent notions of the influence of external conditions on *the race.*

Selection not Starvation.—But hear Mr. Brydon on this crucial point as to breeding Shetland ponies to size in England: "All the mares specially selected at the foundation of the Londonderry stud averaged forty-two inches, and *by*

Digitized by Google

selection alone the average height had now been reduced to thirty-seven inches. Starvation had nothing to do with this reduction in size, for though not highly kept they always had a sufficiency of food." This point of starvation is quite pat. For, following the dictates of the Lamarkian conscience, we are told by Prof. W. H. Brewer, of Yale, that "When small and delicate Alderney cows were a fashionable ornament for parks and lawns, some of the most successful breeders practiced starving systematically, and at least one eminently successful breeder so underfed the breeding calves that it led to prosecution by the local S. P. C. A."

A Last Century Anticipator of Weismann.—The acquisition of characters due to nutrition, the transmission of which is now denied, "strikes at the very foundation," says Prof. W. H. Brewer*, of Yale, "of what has hithertofore been considered an essential factor in the practical improvement of breeds as to size. I have searched extensively the writings of practical breeders to see if I could find a single one who questions it, and I fail to find even so much as an intimation of such a belief." Now we are not at all surprised at the result of Mr. Brewer's search. Any other one instituting a similar hunt we believe would go similarly unrewarded.

It was, therefore, with profound surprise that the writer, while searching for facts in one particular line of this investigation, took down a work published just about a century ago, and found therein the whole subject of domestic variations treated from a thoroughly Weismannian point of view! Now that is surely remarkable. The present writer is indebted to favoring circumstances for thus discovering this eighteenth century anticipator of Weismann.

The author we refer to is James Anderson, LL. D., F. R. S., etc., who is indeed quoted by Darwin as having "peculiar ideas as to the number of endemic races of British sheep," which Dr. Anderson, says Darwin, "numbers at no less than seventeen," and rather seems to ridicule him therefore, but excuses him as "though no naturalist." With all respect to the late Mr. Darwin, we submit that he misunderstood the purport of Dr. Anderson's *classification of variations*, as we would call them; for under *different* numbers may be observed the *same breed* mentioned. Passing by this, however, it is a strange commentary to note that Dr. Anderson's (who was a practical farmer and breeder by the way) whole treatment is entirely from the point of view of *no influence on race from any kind of outside influence.* Variety is, he asserts, a matter of race entirely, and such race variations perpetuate themselves continually so long as selection rules, their characters being preserved thus in spite of change of food, climate, etc., and lost if "intercopulated," which last is simply the same as the modern expression "the swamping effects of cross or inter-breeding," also known as *panmixia.*

In the connection in which we are writing, Dr. Anderson's views, therefore, must appear all important. We can not, of course, reproduce a whole essay herein, but we may give the following, which appears to be a summary of the views of this last century anticipator of modern theories. The views contained are, too, possibly what Darwin himself privately ridiculed, for he ignored them entirely—*entirely*, what his most enthusiastic believers claim is necessary to a true understanding and conception of his own theory, in fact what may be simply regarded as a corrollary to the Darwinian axiom. The work from which we quote is: "Essays.... By James Anderson LL. D., F. R. S., London, 1797." Vol. II contains an enlarged edition of the author's "Disquisition on Wool-Bearing Animals" originally written for the Bath Society in the year 1794. The volume also contains other disquisitions upon questions relating to animals from the same standpoint. The following, therefore, will give the remarkable views of a scientist of the last century on matters which are greatly agitating present day scientists and considering their tendency must, as we say, be regarded with especial interest:

"1. It is now ascertained that all the varieties of sheep yet known do readily intercopulate with each other, and that

*Acquired Characters, *Agricultural Science*, March, April, etc.

Digitized by Google

he progeny is a prolific animal, capable f continuing the species; but that in espect to its characteristic qualities, it s of a mongrel race; participating nearly like of the qualities of both its parents, nd as these mongrel breeds may be intermixed with other varieties *in infinium*, it may in many cases happen that new mongrels may be produced, *in which he distinguishing peculiarities of the riginal breeds may be blended in all ossible proportions and lost.*

"2. The effects of climate and food, *in altering the qualities of the breed, are found to be nothing*, though the effect of these things upon the individual creature that is subjected to their influence, may, in some cases, be very perceptible. For example: It has been shown that the wool of wool-bearing sheep is affected by heat or cold; but this is nearly in the same manner as heat or cold affect the mercury in the thermometer. It is a momentary impulse, which ceases to operate the instant its influence is withdrawn, and the animal, which may have been made to undergo great variations of heat, returns to its former state as soon as its original temperature is restored. But even this variation seems to be felt only by the wool-bearing breeds, and is, besides, of much less powerful influence than has been usually supposed. Nor is there a single fact that has ever been discovered that gives the smallest countenance to the generally received opinion that heat tends either to make the fleece thinner in pile, or to encourage the growth of hairs among it, *far less that it operates*, as M. Buffon and his followers assert, *in producing permanent changes on the descendants of the animals.*

"Heat also tends to accelerate the fattening of some animals, to whom it is congenial, as the hog, to an astonishing degree. Richness of pasture also tends to produce temporary changes on the wool; there is reason to believe it tends to augment its length in some degree, though but a little, it adds to its softness and toughness, but in regard to coarseness or fineness, no fact has as yet been found to ascertain that it has any sensible effect, though I am aware that opinions here are as decidedly adopted as if the facts had been fully ascertained. On the carcass abundance of food is well known to augment the size of all animals to a certain degree, when compared with scanty feeding. A scarcity of food, approaching to the state of starvation, is also well known to render the wool, which grows at that period of starvation, brittle and unelastic.

"3. *The influence of breed, in propagating the qualities of the parent stock, or in altering the qualities of it at pleasure, by blending it with others, may be said to be all powerful. There is not a single fact that I have ever been able to meet with, properly ascertained, which tends to show that the distinguishing peculiarities of any breed of animals can be sensibly changed in its essential characteristics by any change of climate or any other circumstance, except an intermixture of blood alone; but innumerable facts may be found that ascertain the contrary.* The Persian and Arabian breeds of horses brought into Europe are only changed by intercopulating with other breeds. The Chinese hogs may be continued for ages unchanged if no cross be permitted. These facts are notorious, and every other fact upon this subject tends to establish the same conclusion.

"4. Although the same breed of animals appears not to be liable to be changed by climate, or other extraneous causes, yet it is found by experience that *individuals may be met with, among every breed of animals, which are, in some lesser circumstances, different from others, though they still possess the general characteristics of the parent breed, arising from circumstances that have hitherto eluded our observation, and which it therefore exceeds our power either to accelerate or to retard.* So strong also is the propensity of nature, in all cases, to produce its own kind, that if the individuals possessing these qualities, thus, as we would say, accidentally procured, whether beneficial or hurtful, be selected and put to breed with others that possess qualities somewhat of the same sort, it is found that the descendants of these selected animals will, in general, be possessed of the distinguishing peculiarity for which they were selected in an eminent degree; though among these also

Digitized by Google

some individuals will be found to have less of it than others. And if these least approved individuals be banished from the selected stock, and these, both male and female, which possess the wished for quality in the most eminent degree, be put to breed together, the descendants of these will be still more improved, and by continuing this mode of selection for a great length of time, the improvement as to this particular quality may be carried to an indefinite height. In this way may be produced an improved breed, which, though agreeing in the general characteristics with the parent stock from which it was selected, may possess some peculiar qualities in a much higher degree than it does.

"It is of much importance to the practical man to advert to this peculiarity in the economy of nature, because it puts it very much within his power to benefit himself by attention and care, in regard to circumstances that would otherwise seem to be entirely beyond his reach.

For, were he persuaded that certain peculiarities he wishes to obtain are necessarily dependent upon a temperature of climate he never can enjoy, or that certain bad qualities in the animals he breeds are inseparably dependent upon the nature of his pasture, which it exceeds his power to change, he must of necessity sit down contented with what he has, without a hope of improvement; but if, upon examining the facts above stated with attention, he shall find that the influence of breed is so powerful as is there stated, he will be at pains, in the first place, to look around him, to see if he can discover any breed possessing qualities, upon the whole, more valuable than his own, which is found to subsist on pastures of a quality not better than his own; and when he has once found them, continue, with uninterrupted attention to select the best in all respects, particularly those that thrive best among them, to breed from. This has been done by Mr. Bakewell, and those who have adopted his system with such success as not only to establish the principle for which I contend beyond a doubt, but also to give room for encouraging others to adopt a similar plan for improvements in other repects, than those that seem hitherto, to have come within the compass of his plan.

"5. There seems to be no reason for believing that any one peculiarity we may be in quest of is *necessarily* connected with, or dependent upon, any other peculiarity in the animal creation. For example: The improvers of live stock in the present age hold it out to view, as a general principle, that a facility in fattening is invariably connected with certain peculiarities in shape; and of course they conclude, that wherever these peculiarities of shape are to be found the facility of fattening will be found also, and the reverse. This, I contend is a false principle, and I venture to say, that when the facts shall come to be thoroughly investigated, their conclusions will be found to be erroneous; indeed it is in some degree departed from in practice. already, though in theory the principle is still adopted, without limitation. A few years ago shortness of leg was deemed a point indispensably necessary in a feeding beast, and it went the length of almost being deemed that the shorter the better; this is now no longer contended for.

Many of the characteristics of the present day will, in like manner gradually fall into disuse, as people come to open their eyes on this subject. The fact is, I have seen animals that had a powerful tendency to fatten, which are almost, in every respect the reverse of the shape most highly esteemed at present, and the contrary. And by referring every person who has had opportunities of observing many breeds of the same kind of animals, to his own experience, I have no doubt but he will easily recollect instances of the same kind; or, at least, if his mind be unprejudiced, that he will soon have occasion to observe it. To that experience, whether past or to come, I refer on this occasion.

"One circumstance, however, it is necessary here to advert to, *viz.*, that as the breeds of animals from which the selection was begun were originally of very good kinds, and chanced at the same time to possess those shapes that are

Digitized by Google

now deemed so essentially requisite; and as the improved breeds that have been selected have been selected to possess those shapes, *it is by no means an unnatural conclusion to infer that these shapes are in some degree inseparably connected with the propensity to fatten easily.* Had it chanced that equal pains had been bestowed upon selecting from another good breed that was differently shaped, the prejudice would have been equally strong in favor of that shape.

But as the breeds that have been hitherto the object of selection have got the start of all others in point of improvement, it is probable that the prejudice in favor of their shape may long continue to prevail; nor do I wish it to be understood that I have any prejudice against the shapes recommended. Far from it, for I think them very beautiful. I only wish to say, that the circumstance is not essentially connected with the other; for as every error, when admitted as a truth leads to unforeseen and often pernicious consequences, *though the opinion objected to may not be of much consequence in the particular instance under consideration, its influence may be very unfavorable in regard to others.*

"Allow me to add one further illustration on this head: If it is admitted that a faculty of fattening easily be necessarily connected with certain peculiarities of shape, merely because it chances accidentally, as I will say, that these two peculiarities happen to be united in that breed of animals which has been brought forward to notice, we ought, by the same mode of reasoning to infer that that quality of fattening easily is as necessarily connected with coarseness of wool or lightness of fleece, or any other useless or hurtful peculiarity, if it should so happen that the favorite breed chanced to have coarse wool, or a thin fleece, etc. The consequence of this conclusion would be that every man who wished to improve the carcase of his sheep would turn away from every breed of sheep that carried fine wool or a close fleece, as he now does from those breeds that have long legs, or what is deemed in other respects improper shapes, and fine-wooled sheep carrying close fleeces would come to be entirely neglected. But if, instead of this prevention, he should be convinced that it might be very possible to find a sheep that would have a tendency to fatten kindly among those breeds that carry fine wool and close fleeces, he would be as anxious to select from these as from the others; and probably as successful too, if he had set out at the same time with the man who began to select from the coarse breed. I am myself perfectly satisfied, from a variety of facts that have come under my own observation, which would fill a volume merely to enumerate, that fine wool, for example is neither necessarily connected with thinness of pile (the Spanish sheep carry the closest pile of fleece yet known in this country) with shortness of staple. I had once a fleece of wool that measured seventeen inches and a half which was finer than the best Spanish wool I could buy in London, and extremely soft—with tenderness of constitution, with a tendency to fatten slowly, or with any one quality that can be named, though it may be *accidentally* connected with these. And I have not a doubt, but that when the eyes of mankind in general shall be opened, so as to admit of their examining the facts that fall under their notice, without prejudice, they will be able, in time, to select breeds that shall be distinguished not only for one valuable peculiarity to the exclusion of all others, but even to obtain that valuable peculiarity conjoined with most, if not all the other peculiarities that can be desired. *That period is, I fear, still at a great distance.*"

The above views, expressed a century ago, would do credit to the most confirmed follower of the "new views" of to-day. From the above it must be admitted that these "latter day" views were *fully* anticipated by Dr. Anderson.

The portions in italics (which are ours) are certainly remarkable. Their author evidently lived a hundred years ahead of his time. It has taken that time for science to interpret the principles therein laid down.

[TO BE CONTINUED.]

LESSONS OF THE SEASON.

BY HISTORICUS.

THE almost inconceivably rapid manner in which fast records have succeeded each other during the present season has not enabled even the most philosophical followers of the trotting turf the time they ought to have to duly digest them.

Like a dazzling panorama, moving at lightning speed before the eye of the astonished observer, each scene has passed with such marvelous rapidity that it is only when the curtain has dropped and the show is over that he is able to critically compare the various scenes and accurately gauge their intrinsic and comparative features.

It is easy to say that Nancy Hanks has reduced the world's trotting record from 2:08¼ to 2:04, but to realize its full significance the reader must not only take into account her magnificent series of miles from 2:09 to 2:04, but must also in his mind's eye see at the same time the preceding champions, the records which they made, and the time which elapsed between each successive march into the domains of time. Such a picture presents to the view the progress of the breed toward its ultimate goal, and shows on the map of time the exact distance covered.

Thirty-three years ago, on October 15, 1859, Flora Temple astonished the world by passing the 2:20 mark and trotting in 2:19¾. Many conservative thinkers believed at that time the speed limit had been reached, but the breeders of the future, the men who even then had learned to apply cause and effect to the breeding of the trotter and had begun the experimental stage of progressive breeding, saw in the dim distance the 2:10 trotter. But eight years elapsed before the record of Flora Temple was passed by Dexter, 2:17¼, who may truly be said to have inaugurated the Hambletonian era, for, with the exception of Occident, 2:16¾, and Rarus, 2:13¼, all the succeeding world's champions have been of Hambletonian stock. It took four years to knock the record a quarter of a second, which was accomplished by Goldsmith Maid, September 6, 1871. This record she reduced to 2:16¾ in 1872, and in 1873 Occident trotted in the same time, and jointly with her held the trotting throne till July 16, 1874, when the mighty Maid trotted in 2:16, becoming again sole monarch of the trotting turf. September 2, 1874, Goldsmith Maid trotted in 2:14, marking a great step in speed progress. At this point the party of rest and contentment declared that the limit had certainly been reached, and for three years their faith was justified. But in 1878 Rarus put the record down to 2:13¼, and a year later St. Julien carried it to 2:12¾. Maud S. made her 2:10¾ in 1880, and her 2:08¾ in 1885. This record remained undisturbed till Sunol, in 1891, cut it down to 2:08¼, while, in 1892, Nancy Hanks, in one brief season of three months, has reduced it to 2:04.

It will be well to briefly recapitulate these record arches in this bridge of time in order to show to advantage this last magnificent span. Between Flora Temple's time of 2:19¾ and Dexter's 2:17¼, there were eight years. From Dexter to Goldsmith Maid's 2:14, there was a period of seven years. Four years passed before Rarus got to 2:13¼, and two years more were required to get to Maud S.'s 2:10¾. Maud S. took five years to get from 2:10¾ to 2:08¾, and six years rolled around before Sunol chipped off a half second. It took thirty-two years to reduce the record from 2:19¾ to 2:08¼, a net fall of 11½ seconds, or less than 4 seconds every ten years. Yet Nancy Hanks has equaled an average ten years' reduction in one short season.

Maud S. was six years old when she trotted in 2:10¾. In 1881 she reduced this to 2:10¼. In 1884 she trotted in 2:09¾ and 2:09¼, and on July 30, 1885, at Cleveland, Ohio, she made her great record of 2:08¾. Nancy Hanks trotted to a record of 2:09, as a five-year-old, at Richmond, Ind., September 30, 1891. At Grand Rapids, Mich., August 11 of this year she on a regulation track and trotting as a rule in the middle of the track, tied her previous record of 2:09. One

Digitized by Google

week later, on August 18, at Washington Park, Chicago, she beat the world's record by trotting in 2:07¼, a full cut of one second. Grand as this performance was the echoes of the ringing cheers which greeted the marvelous mare had hardly died upon the memory when the wires flashed over the continent that at Independence, Iowa, over the famous kite track Nancy Hanks had again reduced the record, and this time by a straight cut of two seconds. The probable climax of her great career came at Terre Haute, Ind., September 28, when she reduced her record to 2:04. In addition to these three memorable record-breaking miles, she trotted at St. Paul, Minn., in 2:07, at St. Joseph, Mo., 2:07½, at New Albany, Ind., in 2:06 and at Nashville in 2:05. Here are eight miles, only one of which was on a kite track, between 2:04 and 2:09 with an average of 2:06⅜ by a mare six years old. This comparison is not instituted to disparage the great ex-queen Maud S., who will always remain a dowager queen of the highest renown. It is made to emphasize and impress the fact that this is the greatest season of trotting in the history of the national sport, of which Nancy Hanks' career is one of principal incidents.

It will doubtless be said by those who still believe in the fact, that Nancy Hanks like the proverbial swallow, does not make a summer and that her phenomenal speed is exceptional and does not prove in itself the speed progress of the breed. Had the balance of the season been uneventful such a statement would have been entitled to weight, but Nancy Hanks' speed revelation is but the crowning and radiant gem to a tower which is studded with fast performances, of which the 2:15 list affords a most striking illustration.

Up to the close of the season of 1891 there were, according to the Year Book, exactly fifty performers in the 2:15 trotting list. August 12, 1874, Goldsmith Maid made a record of 2:14¾ and was the first trotter to trot in 2:15 or better. It therefore took eighteen years, or to the close of the season of 1891, to produce these fifty. Ten years after Goldsmith Maid accomplished her great task of a mile in 2:14 there were only nine in the 2:15 list including herself. The list is worth reproduction. They were: Maud S., 2:10¼; Jay-Eye-See, 2:10¾; St. Julien, 2:11¼; Rarus, 2:13¼; Goldsmith Maid, 2:14; Trinket, 2:14; Clingstone, 2:14; Hopeful, 2:14¾, and Lula, 2:15.

In 1889, six years later, the total in the 2:15 list was twenty-seven, and the extreme speed figure was 2:08¾. In 1890 there were only six additions to this list, and 1891 only added seventeen, making the aggregate fifty. This season has already added sixty to the 2:15 list and probably before this page is read it may be still further increased. The trotting turf has therefore produced in the present season more 2:15 performers than in all its previous history, and more than in the eighteen years covered by the time from Goldsmith Maid's 2:14 to the close of the season of 1891.

But the lesson of the 2:15 list becomes more instructive the closer it is studied, and the brilliancy of the season stands out in still stronger relief. Next to the empress Nancy Hanks come Stamboul, 2:07½ and Kremlin, 2:07¾, the stallion kings, they being followed by the racing queen Martha Wilkes, 2:08¼, the bright particular star in the crown of her dead sire Alcyone. She has proved herself invincible, when in form, against all comers, and has reduced the race record from 2:12 to 2:08¼ or within one-half of a second of the same ratio as Nancy Hanks has reduced the time record. Close upon the heels of the flying Martha Wilkes come the five-year-old Belle Vara by Vatican, 2:29¼, with a race record of 2:08¾. Had this record been made a day sooner Belle Vara would have held a champion race record, and as it is, her record is 3¾ seconds better than Nancy Hanks' race record of 1891, which again in a startling manner illustrates the sensational character of the present season. The four-year-old stallion Moquette, 2:10, by Wilton, 2:19¼, has captured two records, the four-year-old stallion championship and shares with Alix, 2:10, by Patronage, the regular four-year-old record, beating Sunol, the previous holder, by half a second. In this great young Wilkes colt many good judges think they see the future stallion champion, but with so many

Digitized by Google

good colts within striking distance, it is alike dangerous and premature to prophesy.

Little Albert, by Albert W., 2:20, is only a pony, but he has proved that he is fast and game, and his 2:10¼ is an additional proof that the Electioneers retain their speed from generation to generation and that this great branch of the trotting family may be depended upon to uphold the fame of its mighty founder.

Norval also maintained the fame of the Electioneers by reducing his record to 2:14¾. But it must be borne in mind that at the time this article is written the California season has yet to be finished, and the unexpected very often happens. When the eastern season of 1891 was over and it looked as if Maud S., 2:08¾ and Allerton 2:09¼ were the assured monarchs of the trotting turf, the famous record-breaking meeting at Stockton began, which did not finish till Sunol was queen with a record of 2:08¼; Palo Alto had won the stallion' throne with a record of 2:08¾; Arion, 2:10¾, had made the greatest two-year-old performance of the age, and other records of minor importance had been made.

Though Moquette and Alix have won championship honors in the four-year-old class, the three-year-olds have not been behind, and four great colts standout in marked prominence for special mention. No other year ever produced such a quartette. They are Arion 2:10⅛, Monbars 2:11¾, Czar 2:12⅛, and Directum 2:11¼. Electioneer, George Wilkes, Belmont, Nutwood and Director can claim equal honors in this great four, and again the theories of breeding always taught by the MONTHLY are vindicated and endorsed. While Directum's wonderful mile in 2:11¼ does not give him the three-year-old championship, it gives him the race honors, which are far more valuable to breeders and the public generally who are interested in breeding the trotting race horse.

Another great feature of this remarkable season is the locality of the championship and also the class of the tracks they have been made on. The results will be startling, for it will open up the question as to whether the bicycle sulky with its facility for getting around turns has not minimized the advantage of the kite track, and to a great extent deprived it of its conceded speed honors.

Sunol's 2:08¼ was made on the famous Stockton kite, Nancy Hanks' champion performance on the almost square track at Terre Haute, and her next best performance of 2:05 on the regulation track at Nashville, Tenn. Direct's champion performance of 2:06 was also on a kite track, and reduced to 2:05¾ on a regulation track, while Mascot's was made at Terre Haute. Hal Pointer's two greatest miles in 2:05¼ and 2:04⅛ were made respectively at Washington Park, Chicago, and Nashville, on regulation tracks. Moquette's 2:10 is another regulation-track performance. The race record of last year was on the kite. It now belongs to the regulation track at Evansville, Ind., where Martha Wilkes won her memorable heat in 2:08¼. The team champion record of 2:13 was a kite record; it now belongs to Narragansett Park, Providence, R. I., one of the best regulation tracks on the continent.

The yearling pacing championship has left California and the Stockton kite and is now held by the kite track at Lyons, Neb., through the performance of the bay filly Belle Acton, by Shadeland Onward, 2:18⅛, October 14, when she paced her remarkable mile in 2:20¾. The two-year-old pacing record also leaves the kite track of Independence and goes to Lyons, that good colt Online, also by Shadeland Onward, having made a record there of 2:11. The four-year-old pacing record remains in California, W. Wood having made a record of 2:07 over the kite track at Stockton. The stallion record of 2:08¾ held by Palo Alto has been succeeded by the 2:07¾ of Kremlin, on a regulation track, and the 2:07⅛ of Stamboul on the Stockton kite. Arion's record of 2:10¾, at two years of age, appears to be safe for this year, and it is highly probable that it will long remain as a bright and shining mark for the best of the two-year-olds of succeeding seasons to fire at.

A short table will show at a glance

If, in connection with the reduction of these principal records, the enormous reduction of speed all along the line, and the annual crop of new 2:30 performers (which is larger than ever), is taken into consideration, the reader will realize what a remarkable season 1892 has been.

To what cause can be credited this wholesale reduction of records, or has there been a variety of causes? It is a singular fact that several gentlemen of high reputation, and whose opinions are entitled to the greatest consideration, give the credit of the entire advance to the use of the bicycle sulky.

This broad statement, if once accepted, would lead to conclusions fraught with disaster to the breeding interests, and it should be carefully examined before it is accepted. Will these gentlemen say that with the close of 1891 the speed limit had been reached, and the average of speed attained? Will they affirm that the science of breeding the trotter had reached perfection in the year 1884, and that any combination of blood lines after that date would not result in increased speed?

These conclusions follow the proposition that the increase of speed in 1892 is solely due to the vehicle used. It may also be well to ask why that law of progress in speed which has been operative for over thirty years, should suddenly cease. That the bicycle sulky is a factor, and a great one in the speed problem, must be admitted, but it is only one of several.

Progressive breeding, early development, better tracks, scientific training, are all entitled to their full proportion of credit. No other breed of horses, not even the famous thoroughbred, has ever had, in the same length of time (say the last twenty-five years) as much intelligent thought and capital expended upon its improvement and development as the trotter. It has enjoyed the enormous advantage of attracting the attention of the wealthy men of the country who have made breeding the trotters the main recreation of their lives. Money was no object so long as the desired speed results were attained, and no experiment was too costly if it was based upon an intelligent theory which promised a higher ratio of sustained speed at the trot.

As a result the continent has become dotted with stock farms representing many millions of capital, in which nothing is left to chance and where the cool, experienced heads of the superintendents and the trainers are ably supported by the capital, genius and enthusiasm of the owner. With the advent of the great breeding farms came early development, which is also another great element in the speed increase of this year. Even as late as ten years ago the number of two and three-year-olds in the list was very small. The two-year-old record was 2:21, the three-year-old record was at the same figure, and the four-year-old time was 2:19. They now stand at 2:10¾, 2:10½ and 2:10, and for every one at those ages in training then there are at least ten in training now.

The age of the past champion Sunol, 2:08¼; of the present champion, Nancy

Google

Hanks, 2:04; of Arion, 2:10½ Allerton, 2:09¼; Moquette, 2:10; Alix, 2:10, Kremlin, 2:07¾, and Directum, 2:11¼, is simply indicative of a vast and universal revolution in the training system which, practically originating at Palo Alto, is now followed in every great stock farm in the land.

The old system and the new are as unlike as the old system of searching in the earth for gold dust and the system which now lays bare the quartz and out of a given quantity produces so much gold. The principal cause of the consecutive speed ratio is intelligent breeding and early development. The bicycle sulky deserves also its share, just as the regular sulky of 1891 was a far lighter and faster vehicle than the sulky drawn by Dexter when he made his record of 2:17¼, which sulky was also a much superior vehicle to the one drawn by Flora Temple when she made her record of 2:19¾.

With regard to this branch of the subject the veteran trainer and driver Budd Doble, has recently placed himself on record. The mature judgment of the man who has driven three such champions to their records as Dexter, Goldsmith Maid and Nancy Hanks, is entitled to the greatest consideration. In a recent interview he thus expresses himself·

"I have read a good deal of what has been said regarding the pneumatic sulky and its being an aid to the trotter. I have also of course noticed what has been published to the effect that the mile in 2:08¾, made by Maud S. at Cleveland in 1885 with an old-fashioned sulky, could not be duplicated by Nancy Hanks. People who talk this way seem to forget that last season, on an oval track and hitched to an ordinary high-wheel sulky, Nancy trotted a mile in 2:09, and it was a record. More than this, I know positively that she was capable, just before she was taken sick at the end of last season, of doing the distance in 2:07. I am not surprised at her marvelous improvement, because she is a highly-bred mare, a mare of uncommon resolution and intelligence, and, being only six years old, it would be strange if, with proper care and handling, she did not gain speed. Of course no man can pretend to say absolutely how much difference the pneumatic-tire sulky makes to any named horse, because peculiarities of gait, etc., have a great deal to do with it. I don't think that in the case of Nancy the difference in her favor is more than one second. It is nonsensical to my notion, to talk about going back and trotting to an old-fashioned sulky just to see if Nancy Hanks could pull it a quarter of a second faster in 1892 than in 1891, now that a superior sulky has been made. It would have been just as sensible to have demanded in 1885 that Maud S. trot to a seventy-pound sulky, which was the weight of the one Dexter drew when he set the world's trotting record at 2:17¼, or one that weighed ninety pounds, that being the weight of the vehicle which Flora Temple was hitched to when she made a record of 2:19¾, being the first trotter in the world to make a record better than 2:20. Also it would have been equally as sensible to have claimed that because neither Dexter nor Flora Temple wore toe weights those useful additions to the rig of some modern trotters should have been dispensed with in the case of Maud S., who, as all horsemen know, required a four-ounce toe weight on each fore foot before she could trot at all fast."

"Mambrino," a well-known trainer, writer and breeder, thinks that it makes a difference of from two to four seconds. The same difference of opinion existed about the kite track and public judgment, which has become modified about the latter, will carefully weigh the exact advantage of the former, the general concensus of opinion being that it is not more than two seconds. If this handicap is applied there is still a splendid speed increase all along the line to the credit of progressive breeding.

The improved tracks are also entitled to a fair share, though the lesson of the year would seem to point to the idea that it is the elasticity of the soil and the perfect condition of the track at the time the trial is made, rather than its shape, which conduces to speed. Mr. C. W. Williams, than whom there is no better authority on kite-shape tracks, has stated that the shape was a second faster than the regulation, but that the main reason why his famous Independence track was so fast was on account of the elasticity of the soil. The Indiana tracks are also noted for the same admirable quality. Washington Park, Chicago, has always been noted as a fast running track and when especially prepared for the trotters, with the exception of being a trifle hard, is perfection. Cumberland Park, Nashville and Naragansett Park, Providence, R. I., are practically new regulation tracks in which the great track builder, Seth Griffin, has spent his best experience. The records are now di-

Digitized by Google

vided between the kite, regulation and the square tracks at Terre Haute, so that the advocates of the soil theory apparently have the advantage, subject to the fact that the big advantage of the bicycle sulky is its facility for going around curves.

To these four potent causes, scientific breeding, early and intelligent development, improved sulkies and tracks, may justly be attributed the grand advance in speed during the present season. They have been the scenic artists which have given us the magnificent panorama of speed which has electrified and delighted the countless multitudes who find their principal recreation in trotting sport. Is it not within the range of probability that this truly big four will, in the near future, give us the 2:00 trotter?

WHAT IS NEEDED—A SPECIAL-PURPOSE ANIMAL.

BY BADGER.

THE present demands of the market are for strictly special-purpose horses, and not for what the farmer is wont fondly to call "general-purpose" animals, which, to use the words of some misguided fair associations which still offer prizes for these worthless brutes, are "of sufficient size and strength to pull the plow and of sufficient action to draw the family carriage and carry their owner with safety." An animal that is fitted by nature to be of any use to draw a load is obviously, by that very fact, utterly incapacitated for driving or saddle work. The market reports show, every day, that there is, at all of the great horse centers, an unsatisfied demand for heavy drafters, fine acting coach horses, and good gentlemen's drivers. It is self-evident that the general-purpose horse will fill none of these bills.

In many parts of the country farmers yards are full of horses almost or quite of marketable age, which can not be sold to dealers for any sort of remunerative price, because of the fact that they have not size to be drafters, action or conformation to be coachers, nor anything else to make them desirable as driving animals. A farmer possessed of such an "outfit" generally is heard to say that there is no market for horses, and to clinch his argument points to his own well-filled yard, maintaining, the while, that his horses are as good as those of any one else. Some twelve or fifteen years ago the introduction of heavy draft stallions from Europe began to assume the proportions of a regular business, and in the course of a few years the merchants and warehousemen of our great cities, seeing that heavier horses than those they had been using could be procured, eagerly bought the grades, paying for them handsome prices, which netted the producers a good profit. Immediately that this became known, hundreds of draft stallions were imported each year and the breeding of drafters became somewhat general. As soon as the grades were old enough the buyers came around and purchased all the biggest, so that where a farmer was willing to sell, mares and geldings alike found their way to the city streets and to the pineries. Some few, of course, retained their big mares, but the majority did not, believing that "the old mare" would be able to produce colts big enough to suit the market as long as she lived. This has not proved so, and to-day the fourteen-hundred-pound animals which would have sold readily for big prices, five years ago, do not realize much above the price of common work horses. But these fourteen-hundred-pound mares, bred to weighty stallions of proper type and style, bring forth the sixteen-hundred-pound horses which can be seen in our largest drays and for which big and paying prices are obtained quite readily. These facts lead us to the following reflections:

In horse breeding, as in everything else, sound business judgment is required before success can be obtained, and the old proverb that "like produces like" must never be lost sight of. A definite aim must be established at the outset, and a line, so to speak, chalked, to which all further and future operations must be

Digitized by Google

hewn. It is folly for a farmer who is in love with trotters or light horses to try to breed heavy ones, for they will invariably be a bother to him on account of their slowness of movement; and, on the other hand, no one who loves the draft horse should attempt to breed drivers, for they will always seem too light for him. Consequently, when a man has made up his mind what kind he will raise, the next question to settle is what breed he will patronize.

Any of the draft breeds are good, with the preponderance of the evidence of most handlers of heavy horses in favor of the British Shires and Clydesdales. Having selected the breed, the next thing is to look up as good a representative of that breed as can be found, then use him to such mares as are at hand and in some degree fitted to be his mates. So far we have dealt with the draft horse alone, but the principles that apply to the breeding of this class of horses apply also to the breeding of any other. In the selection of a stallion for use, attention should be paid to his type and conformation, and to whether he is fitted in those particulars to correct any faults the mares may possess. It should be an aim, and one of the first, to so select a stallion that he should be particularly strong where the mares he is mated with are weak or even predisposed to weakness. For instance, a mare with a long back should be mated with a stud very closely coupled, so that the progeny may at least have the chance to be presentable in this important point. Two weakly coupled animals bred together will invariably produce delicate foals, which, on account of their conformation in the loins are not fitted for heavy work of any kind, either in hauling big loads or in traveling long distances. The next point to be looked into in a stallion is that he should be absolutely and perfectly sound. We place this consideration second to the one just given, for the reason that, no matter how sound a stud may be, if he is not fitted by reason of his conformation to properly mate with the mares he is bred to, the results will be most disappointing and the time used lost. No stallion that is not sound should be permitted to serve mares, and even those which, on account of peculiar formations, show a predisposition to unsoundness, should be discarded. It must be remembered that most forms of unsoundness are distinctly hereditary, and are more liable to be transmitted than the good qualities which, together with the unsoundness, the animal may possess. Round bones, round joints, curby formations of the hocks, poor feet, thick throats, and short ribs or long backs should be avoided almost as much as spavins, ringbones, curbs and roaring, for with the predisposition of such infirmities born in the foals, the slightest strain or accident or illness tends to bring on the diseases and maladies referred to. A blemish, obviously the result of an accident, may be passed, but, as a rule, it may be said: "Never patronize an unsound horse."

Another thing which has militated against the success of many farmers in breeding horses that would sell for a decent sum of money is short-sightedness in not paying the fee asked for the service of a good stud, and patronizing some cross-roads mongrel because his embraces could be had for a mare for a feed of oats or a five-dollar bill. Good horses always bring a good price, and no man can afford to stand a high-priced horse at a very low figure. Service fees are low enough the country over nowadays, to give everybody a chance to use a good horse; but the mongrel still holds sway in some localities, and it is a fact that where this is found to be the case, buyers fight very shy of that part of the country, and as a result the people are convinced that the horse business pays no longer. An instance of this cropped out not so long ago in my own experience. In a certain locality in Iowa there is a very large colony of Germans who for years bred and interbred their horses, keeping some miserable scrub entire and using him when he got old enough, and continuing the practice for some generations of their horseflesh. The result was that a more miserable lot of nondescript mongrels never graced—or rather disgraced—a neighborhood. A canny Scot, purchased a large farm just on the outskirts of this settlement and proceeded to break up the raw prairie. He brought with him from Canada some

Digitized by Google

fine mares—not a gelding in his lot—and they happened to be all in foal. In due course these mares produced their foals and their master was good to them. He had two very fine light-legged mares and I think four grade Clydesdale or Shire mares. The driving mares had been bred in Canada to a son of a noted Canadian trotting horse and their chestnut foals were beauties. His neighbors came and looked at the foals as a sort of curiosity, and many a Sunday afternoon I have watched these people driving up to the pasture fence and looking over at the collection of mares and colts, taking their Sunday rest from their labors. Not finding a stallion to suit him in the country this canny Scot drove his mares many miles to a good trotting horse and purchased a two-year-old Clydesdale to use to his heavy mares. He paid, I think about $1,200 for his colt, and his neighbors quickly concluded that he would soon be an inmate of that institution at Independence where flighty gentlemen are taken care of at the state's expense. The second year his colt would have starved to death had he been dependent on his earnings for his bread, but he was not. He was put to work and begot, besides, as handsome a lot of foals from his owner's mares as it was ever my lot to see. To make a long story short, the light-legged foals grew up to be three years and were broken to harness carefully. When their education was supposed to be sufficiently far advanced to admit of their being driven to town their owner hooked them to his buggy and went on his twelve-mile ride. He never brought them back. A Chicago buyer happened to be in the little city that day, and seeing the three-year-olds as they went by, at once hailed their owner, took a short spin behind them, and bought them for $400, of course in cash. The Scotchman walked home, carrying his few purchases on his back, and when his story became known his neighbors almost to a man sought the city and hunted up the buyer, took him out to the prairie telling him that they had lots of colts just as good as the ones he had just bought for $400, and they would not ask half as much for them. It is needless to say that none of the colts changed hands; but it caused a revolution in the horse breeding in that section, and I am satisfied that to-day there are just as good horses standing for service there as can be found in any of the farming districts of America.

The next point to be considered after having selected the stallion is with regard to the mares that should be bred. The same holds good with regard to the mares as with stallions—no unsound one should ever be bred, and no poor one should ever be permitted to reproduce her worthless self. Many men consider that as long as a mare will breed she ought to be given the chance tc, but this is utterly wrong. We have poor horses enough in the country without breeding more. Poor ones will come even with every precaution taken in the way of selection of parents, and therefore it is the worst kind of folly to breed a poor mare to any kind of a horse. And when it is remembered that a poor and worthless mare is as a rule not considered worthy of the embrace of even a moderate stallion, but is put to the cheapest mongrel that can be found, the truth of my assertion that a poor mare should never be bred on any pretext becomes more apparent. Having gotten a start in the right way, selecting the best, no change should be made with the breed patronized at the beginning. How many do we see breeding first to a draft horse, then to a coacher, then to a trotter, and finally losing with each successive cross of new blood all the good that the preceding one had done. In many sections the phenomenal success of Mr. Williams caused many to try to emulate his great deeds and in the state of Iowa in particular many great big fine draft mares were bred to some nine-hundred-pound trotter in the hope of an Axtell being the result of the union. The *Breeder's Gazette* remarked about that time that the eventual selling price of the results of these misfit unions would never cover the prices of the services, and I believe that such has proven to be the case. I have known several who about that time bred mares with two crosses of draft blood to standard-bred trotting horses, and to this day have not

Digitized by Google

been able to sell the progeny. Breed in line, selecting the best from generation to generation, is an excellent principle to follow. This practice, if followed, will very soon evolve a special-purpose animal, which has the qualifications for some special line of usefulness, and can therefore be sold for that purpose and a remunerative price obtained. To obtain draft horses heavy enough for the market of the present day, at least two crosses and generally three, of draft blood are necessary before the required weight can be obtained. The animals graded up from the native stock of the country are hardy, and the slope of the pasterns is generally such as to protect the feet to a great extent on the pavements. Many of the draft horses which have been imported to this country and sold to stallioners have been defective in this point, such defect being a detriment to them and causing their price to be low enough to admit of a fair profit being made on them after importation. The long, sloping pastern of the native has tended to counteract this defect in a very great degree, and I believe it to be a fact that animals graded up make better workers in our streets than do full blooded animals bred from imported parents on both sides, for the reason given and for climatic reasons that must be apparent.

With coach horses the evolution of really typical animals is a much longer business than with draft horses, for in the first place some of the breeds of coachers are not very impressive as sires, the large preponderance of racing blood in them tending to a lack of uniformity in the produce. For this reason more top crosses of coaching blood are necessary to get really first-class coachers. Those, however, who are engaged in breeding this class of horses, will find some comfort in the grand prices that are ever ready for a handsome coach horse, with the proper style, action and conformation. In this line of the horse-breeding industry the greatest and most frequent disappointments occur, and these do occur for the very reasons named. Consequently there is more temptation to switch onto some other line, but no one who has made a start with the coachers should do this, for after success is gained and a selling class of horses produced, much money may be gathered in each year. Amongst the drivers one sees in the streets perhaps the greatest diversity of type is discovered. It is hard to lay down any fixed rule for the breeding of this class of horses, except that there is no horse on earth so well suited for getting drivers as the standard-bred trotting horse. In drivers we must have quality, and lots of it, and a certain sprightliness of carriage joined to trappy action, which certain strains of the trotting horse possess. We do not want anything of coarseness, but we want a sufficient substance to pull the buggy and go along at a fair pace. We are not talking of 2:20 road horses, we are talking of producing animals that will supply the demand for gentlemen's drivers —horses without any great amount of speed. There is only one way to get this desired conformation, quality and action, and that is to breed our mares to stallions themselves possessing these qualifications. We must not expect that because a horse has a long pedigree, showing that he has nothing but the bluest blood in his veins, that he will beget us the class of horses we want, nor can we expect any horse, though he is good looking as possible, to reproduce his own image with reasonable regularity, unless he is well bred. We must watch for and obtain a combination of both, before we can hope to obtain the best results.

Now, when we have got the foals we must take care that they have the very best of attention, more especially during the first two years of their lives. It is a common practice to turn the mare and foal out into the pasture, and unless some accident befalls one or the other of them they are left there until snow flies. The grass gets short in autumn, and the flies annoy both so much that the milk supply is cut off and there remains nothing but the short tough, brown grass for the foal to make its living off. As a consequence the flesh that was born on its bones and kept there for a time by the mother's milk wastes away and the foal goes into winter quarters thin and in the very best possible shape for disease to fasten upon it in some shape or other. Liberal feed should be supplied to both

Digitized by Google

and suckling as soon as the con-
on of the pasture calls for it, and some
in should always be in reach of the
ngsters from the time that they will
ble at it. In this way the first flesh
reserved, and a thrifty colt goes into
ter quarters strong and well able to
bstand the rigors of our northern
nate. Everything should be done to
her the healthy growth of the foal,
every means should be taken to
e him as well acquainted with his
ters as possible. Every foal should
halter broken as early in its growth
ts health and strength will permit,
the same may be said of the process
arness breaking. All colts intended
driving purposes should be harnessed
later than the fall after they are a
r old, and after they have been way-
ed they may be turned out for a whole
r, and when again taken up they will
found to have remembered what is re-
ted of them. The older a horse is
ore he is broken the bigger the job it
control him and the more nervous
rgy is lost in the process. All matter
taining to the subsequent development
he animal should be made the object
pecial attention if we are to have a
cial-purpose horse in the end. When
lt has reached the age of three, he
omes of some little use to his owner
should be put to light work of some
d. He should be driven often within
t and hearing of such objects as will
rally frighten him, in order that he
get accustomed to them and know
they will do him no harm. Then when he reaches a marketable age his education is complete and the buyer finds him a thoroughly broken horse. With this part of a horse's schooling it is as with all other portions—the sooner it is done the easier it is. I know of a man who has a pasture through which a railway runs, and over the track he constructed a bridge. The mares and colts are always kept in this field, and I have never known a colt of this gentlemen's breeding being frightened at a train. Familiarity breeds contempt, is verily applicable to a horse's manner of treating things that frighten him.

Having bred our special-purpose animal and having trained him with a special purpose in view, we will experience no difficulty of obtaining a special price for him; but if we breed the special-purpose animal and do not take care of him as such, but allow him to rough it "to toughen him," we will lose all that we made in the first place in starting right.

Even if we do take care of him as we ought, but fail to train him with our special purpose still in view, we will yet lose a great portion of our special price and some one sharper than ourselves will take up the work where we laid it down and reap the reward of our labor. Hence it is not only necessary to complete success to breed special-purpose animals, but to raise and train them with the proper end in view and in the proper manner. If this is done, no matter what the line taken up, success will surely follow.

A LITTLE MORE PHILOSOPHY.

BY JOS. CAIRN SIMPSON.

TOR WALLACE'S MONTHLY:

EAR SIR—Four weeks ago to-day I te the short article on the "Philoso- of the Trotting Stride," and that one of the hottest Sundays in my eteen summers' experience of Oak- d weather. To-day is the first rainy day since early spring, and has ught unexpected leisure to write a e more in relation to the subject, and ch may reach you in time for the November number of the MONTHLY. Before commencing the disquisition on the stride it will not be out of the way to state, that yesterday, the opening day of the fall meeting of the Pacific Coast Trotting Horse Breeders' Association, a part of the new method of starting horses, described in your October number, was put to the test, and with satisfactory results. The starter was placed on the opposite side of the track from the judges,

Digitized by Google

and starting the horses his whole duty. On the Oakland track the judges' stand is on the outside, the proper location, and this gives a better position for the starter. He used the pedestal built for the racing starter, and had cords attached to the bell and gong in the judges' stand. His assistant was stationed a short distance above the distance pole, and the result, five races finished from 12:30 to 5 P. M., enabling visitors from San Francisco to reach home by 6 o'clock, none too late for dinner. The drivers approved the change and did their part to lessen the "intolerable prolongation" due to repeated scoring. One of the races was a walk-over, and in the four which were trotted there were only five failures to get a "send-off." That it will give still greater satisfaction to place the starter a short distance up the stretch, there is little doubt, but it was thought best to try the remedy in broken doses for the present.

On that hot and electrical Sunday, when anxious to finish the job in time for the overland mail, a query was propounded which at the time was thought to be puzzling, when in reality a little attention gave the cue for a true answer. The question was: What caused the variation in the stride of Edgerton from eighteen feet three inches in harness to seventeen feet and six inches under saddle, and at the same time increase the space between the imprints of hind and front feet from five feet six inches to five feet nine inches? To be plainer, when in harness Edgerton placed the left hind foot five feet and six inches in advance of where the left fore foot made its mark, and under the saddle thrust it three inches further forward. Presuming that this will reach you in time to accompany the former article, the diagrams in that will not be duplicated, and will serve the purpose of illustration, if not as well as would result from a more elaborate representation.

When in harness the space between the toes of Edgerton's left hind and right fore feet when they were on the ground was three feet seven and a half inches; under saddle this was three feet. Therefore the fore foot was not carried so far forward when in the air-flight and the hind foot extended three inches further to the front. The solution then is readily presented. The addition of weight on the back changed the center of gravity and the supporting feet were placed to meet the situation. The other query regarding change of shoes to overcome the variation is necessarily superfluous, as with that condition in force all patterns of shoes would be inadequate to overcome natural laws. Many years ago the fact was established that under saddle a horse shortened his gait, and some of the long-striding, dwelling-gaited horses could trot a good deal faster when the change was made from harness to saddle. But it must be kept in mind that the vehicles of that period were far from the perfection of sulkies of the present time, without taking into consideration the latest improvements; and were trials instituted I am of the opinion that few of our fastest trotters would equal their harness performances, however skillful the rider, although the absence of wheels would permit keeping so much closer to the inside as to shorten the distance materially. "Short-gaited" horses, as those of rapid action were then designated, did not show as well under saddle comparatively, and these were good grounds to claim that shortening the gait was advantageous as loss in stride was more than balanced by a quicker stroke.

While my intention in this article is to present the solution of the puzzle, which a few moments' study shows to be very simple, it will not be amiss to call attention to another erroneous idea that there is a marked discrepancy between the strides of the hind and fore feet.

The diagram showing the foot marks of Elaine proves that the left hind footprint overlapped the left fore footprint five feet one and one-half inches. The left hind and right fore supporting the body at the commencement of that stride. As shown in the former paper these feet move on lines 12 and 16, or so nearly on these lines as can be told from the small size of the plates. When the stride is half completed, and the opposite feet sustain the body, the right hind is on line 21, the left fore on line 25. The twenty-

Digitized by Google

four figures on the plate do not give a stride and a half as long as that of Elaine or Edgerton, but they do show that whether the measurement is taken from the toe of the left hind or that of the right fore there is the same length of stride. Many years ago I wrote that what was called a stride in a trotter was virtually two, following the old-time rule, which governed the stride of racehorses, to measure between "five tracks," and this formula has been followed in fixing the trotting stride. But to make the five tracks—*i. e.* the footprints—of the race horse there is one air-flight, there are two in the trotter, and the cameras show what it would have been impossible to delineate in any other way—the positions of feet and legs during the interval when the body is without support.

In the twenty-four pictures in the Elaine plate, the second shows the position of the fee twhen first in contact with the ground. A perpendicular from the toe of the fore foot would come a trifle in front of the nose, from the hind foot a short distance behind the saddle tree of the harness. The body is carried over these supports until at figure 7 the toe of the hind foot barely touches, the fore foot is clear, and a perpendicular will bisect the body a few inches in front of the stifle, that from the hind not much in front of the end of the extended tail. Figures 8, 9 and 10 the feet are in the air, nearly if not quite four feet being the mark of the air-flight, which of course gives eight feet, or in the neighborhood thereof, for the whole stride. The beginning of the air-flight is shown by the figures to be the point at which "scalping" takes place, the fore and hind feet on the same side being in near proximity. In the next figure, twelve inches further along, the fore foot is elevated above the ankle of the hind leg, still higher in the next figure, and when the opposite fore foot touches the ground at the end of the air-flight it is almost touching the body. Some horses bring the foot so high as to strike the body, and a pad is necessary to protect the part. There is a marked difference in the plates of Elaine and Edgerton in respect to the position of the feet in the air-flight. In that of Elaine there is a space between; in Edgerton the fore foot is so close to the hind foot as to hide the hind foot partially, and at the highest elevation is closer to the body. An expert, after a study of the two plates, would not hesitate in awarding the premium for the best trotting action to Elaine. While the length of stride is the same, whether the measurement is taken from fore or hind foot, the extension of the feet when first brought in contact with the ground is an important point to study, as there is a wide variation among fast trotters in that respect. "Getting the fore feet out of the way of the hind feet" is at times a source of trouble to trainers, especially in colts which thrust the hind foot directly under the fore foot at the commencement of the air-flight. Different forms of shoes, toe weights, boots, etc., have effected wonderful changes, and horses which were unable to show a reasonably fast gait before the right remedy was found, and which, in all probability, never would have trotted fast if not assisted by some or all of these appliances; with their aid accomplished great feats. There is another favorite assertion with those who claim that the strides of fore and hind feet are unequal that being the shortness of the fore legs when compared with the hind, and, consequently, the "reach" must be shorter. Taking the first articulations to measure from, and following the angles from "whirlbone" to foot and point of shoulder to foot, that would be correct. But the movements of the shoulder blade must be made a factor in the calculation, and that will present features which are rarely considered. When the foot is at its farthest point of extension, the lower part of the scapula is carried forward, the upper part thrown back, so that all the bones are nearly in line, the angle formed by scapula and radius being quite obtuse. As the body is carried over the supporting fore foot, that angle becomes more acute, the top of the shoulder blade thrown forward, the lower point further back. The upper, posterior articulation is a fixed point, the anterior movable, so that corresponding points to measure from can not be fixed with exactness.

Digitized by Google

There may be a difference, however, in the velocity of the hind and fore feet, and in changing positions, when not acting as supports, a difference in the rapidity of their motion, a lower sweep of the hind foot, a higher curve inscribed by the fore foot, the former showing the most speed, both occupying the same time in covering the same distance of ground.

Oakland, Cal., October 19, 1892.

NOTE:—To make clearer the expression used in the article, "The cameras show what it would have been impossible to delineate in any other way"—that impossibility arises from the eye being unable to convey to the brain the rapidity of movement with sufficient clearness to leave a distinct impression. In a rapidly revolving wheel the spokes appear to be a solid mass to the naked eye. The instantaneous photograph shows them distinct and the picture is that of a wheel at rest. Eighteen pictures, taken at intervals of one foot, are required to show all parts of the stride of eighteen feet. During the two air-flights there are four silhouettes so nearly similar that the difference does not strike a casual observer, thus being the positions which artists depict to illustrate trotting action. While the supporting feet are on the ground the body is carried forward about five feet, and during this time the non-supporting limbs and feet are moved with great rapidity and with changes of position which the eye could not follow. Each position is given by the camera in the same way that the spokes are represented, quiescent, and when shown to a person for the first time it appears to him like a caricature of trotting action. or the imaginings of an artist suffering from jim-jams. But place a strip of paper, on which these grotesque images are represented, and put them in a zœtrope, set the wheel in motion, and the awkward little puppet is imbued with life, the square trotter before you showing the clean stroke in perfection. The figures which represent the fast gallop are still more grotesque, though the revolving wheel transfers them into the "poetry of motion," and, however, hypercritical the observer, he can not deny that they are true representatives.

Showing these figures in the zœtrope to a friend who is a large breeder of cattle, when the galloping steer was put in the machine, he broke out in a torrent of enthusiastic praise: "More natural than the steer himself," he exclaimed, "see his tail whisk, his eyes roll, and his ears flop. Why in — don't he bawl? He is tiring now, and the vacquero will soon have the rope on him." Lots of amusement in a dozen of these strips and a zœtrope, a fund of information; knowledge never obtainable until the costly experiment was inaugurated at Palo Alto, the best part of $100,000, a munificent gift which will never be appreciated.

J. C. S.

THE TROTTING STRIDE.

BY S. T. H.

THE adverse critique of the author of "Horse Portraiture" on the writer's elucidation of the trotting stride is not a matter of great surprise. In that compendium of horse vagaries there are multitudinous crochets as curious as his present assertion that all trotting horses, at speed, extend the front feet and limbs further forward than the hind ones. It is amusing to trace the devious opinions of horsemen on this subject. Many observant drivers contend that if the front feet extend further forward than the hind ones, the forehanded section of the animal would reach the wire while the hind quarters were industriously working themselves forward at about the distance stand. Others, equally sanguine, assert that if the hind footprints overlap the front ones, then the hind quarters would reach the goal far in advance of the forehanded section of the horse. Still a third class of experts affirm that the stride is balanced only when the hind footprints dip into the front ones. All three asser-

Digitized by Google

are measurably correct, but no one is exhaustive of the subject.

To reduce to the *reductio ad absurdum* the position of my reviewer that the trotting horse, at speed, invariably extends his front feet further than his hind ones, no matter what may be his conformation or peculiarties of stride, it is only necessary to marshal the manifold interferences of forging and speedy cutting and overreaching of the hind limbs and feet, that can be overcome by changing the position of the head and neck and arming the two pairs of feet with shoes that materially differ in shape, weight and pattern. If the trotting horse, at speed, always extended his front feet further forward than the hind ones, and the extent of the greater extension is invariably governed by the degree of speed, then, manifestly, the science of farriery can have no influence in changing the length of the stride of either the front or the hind limbs. All the study and skill in that direction has been simply a misapplication of mechanical science, and the rolling-motion shoe, the projected heels of the hind shoe, and the myriad patterns, including the beloved "tips" of our reviewer, are merely the fantasies of unbalanced ingenuity. The triumphs of the American horseshoer, as well as the observations of the American horse-owner, and the marvelous improvements that have been made by dressing and shoeing the horse's feet with reference to adjusting his stride and perfecting his action, one and all proclaim this conclusion of "Horse Portraiture" to be untenable.

He claims the footprints of his "young mare of great length of body and limbs" prove that she has a stride of only *eight feet ten inches, in a jog, and fifteen feet at a 2:50 gait!*

She is a trotting phenomenon. The reader may measure the strides of any number of trotting horses, not of great or unusual length of body and limbs, but as compact as the average Morgan pony, and very rarely will he find the jogging stride to be as limited as eight feet ten inches, or even twelve feet. Moreover, let him measure the stride in a walk, and he will be still more convinced that the particular mare under consideration is a curiosity. When the speed is quickened to a 2:50 gait, he will measure the movement of any multiple of average trotters, and still more rarely will he find the length of stride to be extended when passing from the jog to this rate of speed the one-half of six feet two inches, which "Mademoiselle Portraiture" gained with tips on her front feet. The query arises that at this ratio of increase how great would be the length of her stride at a 2:20 gait?

Then her subsequent movement is equally astounding. When she jogged the hind footprints exactly landed into the front ones on the same side; but when the speed was accelerated to 2:50 the stride was not only extended the enormous increase of six feet two inches, but the front feet overlapped the hind ones six inches at every stride, notwithstanding the main propulsion is located in the hind levers. At a 2:20 gait the forward extension would be still more excessive. Moreover, the "*eloquent peroration*" of twenty-four cameras ranged one foot apart, and operated automatically is presented from the instantaneous photographs of the Palo Alto series of "The Horse in Motion," to prove that the front limbs of Elaine strode thirteen and a half inches farther than her hind ones. Of course this difference was verified by measurements of the footprints. In no other way could the relative lengths be determined if the cameras had been increased to one hundred.

Now the question arises of what possible utility were the cameras in this experiment? If the hind feet were armed with shoes entirely different in pattern from those worn on the front ones, the footprints would have been so distinctively different that there could be no possible chance of mistaking one set for the other. Indeed, if the shoes were of precisely the same pattern, so different is the shape and size of the hind feet from the front ones that no error could befall even an ordinary horseman. The only precaution necessary, therefore, would be to measure accurately the distance between the front and hind footprints on the same side to ascertain the difference between their respective strides. Indeed, the cameras could play

Digitized by Google

no determining part in these investigations of distances.

Instantaneous photography has performed some effective service in analyzing the galloping and trotting movements, but, beyond the domains of California, it has never been accepted further than as presenting a curious exhibition of the anatomy of motion in sections. The apparent broken-legged girations of the limbs and feet, while in mid air, were genuine revelations; but the entire articulation, giving the well-rounded, graceful stride, either in galloping or trotting, can never be presented in sections, which alone is the disjointed province of photography. These sectional exhibits are the antipodes of the poetry of motion.

They will never be accepted, either in art or by the unaided vision, as satisfactory substitutes for the beautiful curves of the equine movement, as an entirety, which the eye, more wonderful in the completeness of its visual observations than the camera, or any number of cameras, with their limitations to stereotyped, piecemeal impressions, convey to the brain.

The horses whose footprints were measured by the writer were shod with plain plates in front, and the hind feet with the outward-curving, outside, projected, posterior heel of the popular pattern. The same horses, and many others, have since been walked and jogged and speeded over the planed surface of the race-course. The hind footprints were just as distinctly observable as the front ones.

The results were precisely the same as presented in the paper to which my dissenting friend refers. There is just as much difference in the placing of the feet at speed as in the jog. When he asserts that in all cases the trotting horse at speed extends the front feet further forward, at every stride, from six inches to two feet nine inches, as in the instance of Edgerton under saddle, than he does the hind ones, the writer has only to suggest that if he will add to the number of his tests, from differently-gaited trotting horses, he will come to the more comprehensive conclusion that some horses, at speed, place the hind footprints at a less distance than the front ones; that others send the hind feet in advance of the front ones; while still a third lot cover exactly the same footprints. This matter fortunately need not be confined to the theses and diagrams of turf writers. Any horseman who appreciates the fact that a completed stride is made up of two rests and two flights, and that the length of the stride comprehends the footprints of the rests, the flights intervening, can easily verify these statements by tape-line measurements.

These experiments will be more satisfactory to the demonstrator than any further observations from either the writer or the author of "Horse Portraiture."

WINTERING HORSES.

BY RAY MARSHALL.

ON the approach of winter thoughtful care for the horse is required from every owner. Of course in the case of those who keep their horses, as it were, by proxy, the extent of their anxiety for the welfare of their horse usually ends with the selection of a boarding stable, or a groom who gives evidence of understanding the care of such stock. The appearance of the equine from day to day as the owner sees it usually enables him to determine whether or not the right sort of care is afforded. In the case where the horse is uppermost in mind when drawing his owner about the streets on business trips or tours of pleasure, a slight decline in the condition is readily perceptible. The advice of a veterinary will usually enable one to determine whether there is any serious trouble, and in the case of an animal with blood lines that are valuable, and superior qualities as to merit in form and disposition, this course is usually advisable; but where the animal has only ordinary value a suggestion from the owner to the groom

Digitized by Google

ıt the horse seems out of condition ıy enable him to make a change in feed discover by observation the neglect ich occasions the trouble. It is true ıt a faithful groom will occasionally ɔrlook the change in condition of the imal, where it eats its food regularly. ɜernal troubles, such as worms, etc., netimes affect the animal seriously :hout impairing the appetite or its ;or, for a time.

[t is therefore important that the ner, as well as the one who feeds and ɜs for the horse, keep a vigilant eye its condition. During the summer ıson and in early winter where the imal may be turned on good grass and, it were, have its system renovated, ɔre is not the need for such constant ɜ of the work horse. In cases where is not profitable to employ skilled ınsel the pasture lot affords, so to ɜak, a good hospital. The man who ns and works his own horse is far too en indifferent regarding the condition his faithful worker from day to day. grossed with cares his attention is too dom brought to bear upon the condi- n of all his farm stock. Such men ɜd to be reminded continually of the portance of observing, constantly, the ɜironments of their stock, and especial ention should be directed to careful ɜervation of the excrement. As abun- ıt and cheap as common salt is in the rld, its worth as a tonic for the live ck is too little appreciated. Every n or boy about the stable should know ıt it is in demand in the case of every imal which shows dry and hard excre- ınt. On this subject it may be urged ıt the horse's food should be salted ɔry day, the same as is that of the man family. Where rock salt can not provided and kept constantly within ıch of the animal it is important to ɜe a box near the feeding manger in ich as much as a peck or half bushel salt and wood ashes mixed is kept. om this, at least once a day, the feeder ɔuld take a liberal "pinch" and furnish each horse under his care. It is to be ;retted in some respects that the plan former days among farmers of salting hay liberally, when putting into the : or the barn, has been to a consider- able extent abandoned. There are times in the case of some horses when this is yet the better way to provide their salt. This is true where the animal is greedy in licking up a lump of salt at frequent intervals. Some strong brine sprinkled over the hay for such animal will usually keep the system in better tone than to allow the clear salt. In this connection it is well to note that it is particularly desirable to water the horses before they are fed grain, especially where lump salt is kept before them or where it is supplied in moderate amount every day. This practice has the tendency to diminish an abnormal greed in this direction. It may be observed, too, that in the case of feeding oats almost exclusively without the supplementary condiments, such as flax seed, oil meal, etc., more salt is required by the horse than where there is a free and regular mixture of the grain food. This applies also in the case of over-ripe hay or straw. There is perhaps no food which so calls for a generous amount of the saline element to neutralize its effect, as hay ripened into a hard, woody fiber or straw matured to the same condition. It is gross ignorance and cruel economy in one to plan deliberately to use such provender because of the fact that it always "goes further," requiring, of course, fewer tons to feed a given time. Such food, in fact, when possible to do otherwise, should be kept in the barn in only limited quantities. Its value as food is mainly in being available for the correction of a bad condition of the system of an animal in which the state of the internal organs is too lax. When used alone continually it is the usual cause of almost constant costiveness. Of course there is to be found hay that has been put up prematurely. Feeding this tends to correct somewhat the effects of the over-ripe fiber, while the reverse is true to a greater extent. Of the two, of course, the unripe hay is more desirable. The different kinds of provender and their effects on different animals at the different stages of winter and in their condition, is one calling for deep study.

The use of clover, millet and timothy hay requires more or less care. In the case of broodmares it is particularly to

Digitized by Google

be noted that only a sparing quantity of millet should be allowed them, and this should be begun very gradually, and, as a rule, it is better to feed it as a part ration with mature timothy or good, bright, prairie hay. In fact only as a matter of almost absolute necessity should it be fed in such cases at all. It is true that among general farmers and in the case of some special stock farms that a shortage of the hay crop compels the use at times of millet and other provender that operates on the system of broodmares with the same effect. It is a safe rule when one does not thoroughly understand the intricate relation of such food to the case in hand, to avoid its use. There are localities, however, in which the importance and true value of this article are so great that stockmen must necessarily inform themselves as to how to feed this article. The necessity of variety of provender about the barn in winter can not be too much urged. The horse seems to seek frequent change of food more than almost any other domestic animal. When it is observed that when turned occasionally only into the lot or pasture that it seems to devour often very loathsome sorts of food, one sees in this evidences of a great lack in the food supply. While it is generally recognized that flax straw and oil meal must be handled very carefully, the apparent necessity of the latter, at least, calls for a careful study to know its nature and the means of adapting it to the wants of domestic animals. It is a matter of regret, however, that many feeders and breeders of stock go to the other extreme of using too much of such laxative food. With a greater variety of the grains that may be used for stock food, and by understanding the constituent parts of these foods and their relations one to another, the necessity for the use of oil meal could be much reduced and the condition of the horse in winter could be maintained at less expenditure of money and anxiety. The conscientious feeder who thinks of the possibility of bringing deranged condition and consequent suffering upon his horses always feels, as it were, that he is handling edged tools in the use of such food material, and is liable to sometimes go to the other extreme of neglecting to provide a laxative part-ration. It is not within the scope of this article to analyze the composition of any one food, but the aim is only to sound the alarm to beware of mistakes. The men who are particularly interested in securing a substitute by means of combinations and varieties should seek through the stock journals and agricultural papers of the country to draw out the personal experiences on given points from those who have given a subject a thorough test, from which they have been able to draw rational conclusions.

The chemistry of food relations is so intricate that the experience of one season is not usually sufficient to enable any one to state a dogmatic fact. For instance, in reference to the subject above alluded to one breeder will state emphatically that with broodmares he can use certain questionable laxative grains freely with impunity. During the same season another compeer will state the reverse as the result of experience with equal or perhaps greater emphasis. It is only by much comparison of results and close observation of the methods of mixing such articles with other foods that careful directions for use can be derived. While it is an easy matter to provide other articles to secure the same effect when used as food or condiment, one must be continually on his guard for new difficulties which may arise from a combination of foods with which one has had but little experience. In the case of broodmares it is a mooted question, whether, at times, rye should be fed to them at certain stages. With some considerable observation in the use of this grain, we feel slow to agree with those who claim that this grain fed to breeding animals of either sex tends to impair fertility. It is certainly true that the growing rye for grazing purposes and rye straw in moderate quantities as provender, has little, if any, effect in either way in this respect. It is probably true also that in cases where it has apparently seemed to affect the fertility of breeding animals, that this result followed not from the rye alone, but possibly from a wrong combination of the grain with some other article of food. In the case

of growing colts, the males can safely be fed a proportion of rye grain with oats and corn, in the case of the males that are intended for geldings. It is also true that for geldings used as work horses there is no better part-ration of grain than rye ground in equal parts with oats and corn. There is no one variety of grain which has so varied a relation in feeding as wheat and the products of it used for stock food. The coarsest bran often seems to have scarcely any food value and can be used to advantage mainly as a tonic or for laxative results. The numerous grades provided by the intricate processes of the modern mills make it necessary for the feeder to be on his guard as to the quality or strength of the bran. When the whole wheat is considered as a food for horses extravagant claims are made for its virtue in some respects. Some farmers for generations have practiced the policy of mixing a little wheat with their oats when growing it in the field. Many of them can hardly give a reason why they do it. The remark that a little wheat is good for the horse is the extent of the philosophy of many of these men in their pursuance of this practice. Some very intelligent men, however, as well as writers, claim for the use of wheat that it is valuable to feed to breeding females to guard against the possibility of abortion. In the use of this grain with this purpose in view, however, it is well to remember that it is rich in the qualities of food that tend to fatten. Those who believe that it is important to guard against a high condition of flesh in the breeding female, must take into account the fact that but a limited quantity of wheat can be fed in such a ration. It is well to note the theory, however, and serious results are not liable to follow a limited use of this grain as a preventive of this serious difficulty on the horse-farm for which preventive agencies are sought far and wide, often at a considerable expense, when it is probable that this simple grain, found everywhere, used rightly, will prove fully as effectual. It is true that the usual great difference in the value of corn and wheat is such as to deter any extensive use of the article so commonly used for human food. Yet, when it is considered that one bushel of wheat weighs but a little less than two bushels of oats, the difference in the values of these grains is not so great as is very often imagined. It is not always possible to know definitely the cause of the many satisfactory results of feeding preventives or of administering treatment for cure. Nor is it an easy matter to determine in many cases the right course to pursue when difficulties are in sight.

It is the belief of the writer that in the case of animals which have never aborted that it is best, usually, to feed no preventives, at least not until near the period of maturity of the fœtus. However, in the case of those having once had this trouble, at the same stage of development in the next case it is well to employ preventive remedies in the way of food of this sort for a month or six weeks prior to the period similar to the former time of difficulty. It is worthy of mention here in reference to this theory in regard to wheat that the remark was made to the writer some years ago by a man who had handled and bred a great deal of farm stock, including horses and cattle, for a dozen or fifteen years, that he had never had a case of abortion on his farm in all of his experience. Incidentally, the information was obtained from him that it had been a practice of his, learned from his father (and followed, he hardly knew why, except with the theory that the stronger stalks of wheat might sustain the oats from falling down in the field), to sow, regularly, a little wheat with his oats in the springtime, the result of which was that all of his oats when fed to the stock contained a fair sprinkling of wheat. On the other side, it may be stated that a prominent owner of a stock farm of several thousand acres, on which were kept hundreds of breeding animals, made a practice of using a little wheat regularly as an intended preventive of this trouble. After three years of trial it was discontinued, and in six years' time, including the three years following the period of abandonment of this practice, the testimony of this man was to the effect that he could see no difference

one way or the other. From these two cases it might be inferred that it is a safe policy to use this preventive in any cases of probable seriousness, on the ground that it can do no harm and may be the thing desirable for such cases. It is certainly true that so simple an article is far to be preferred to a foreign drug about which one knows scarcely anything. It is a lamentable fact that too often the average man is more ready to accept a remedy offered by a total stranger whom he has never seen and never expects to see, perhaps, than a simple suggestion offered by a friendly neighbor or his other good friend, the printed page which he reads regularly.

After all, however, this matter of abortion is not the most serious trouble about the average stock farm. The numerous little things which come up every day for adjustment and a decision, in the aggregate, amount to more in the way of profit and loss during nearly every year than this apparently serious trouble. There is probably a greater loss of foals from neglect at birth or during the few days following, on nearly every farm. Recognizing this fact, too, many farmers and special breeders continually neglect to provide for the little details which are important in such cases, so that this source of serious loss on the breeding farm goes on from year to year. In the majority of cases where the animals in question are only of common breeding, perhaps good grades in some cases, there is no systematic preparation for the care of both the dam and the young for a fortnight before and after this critical period. Breeding establishments may be found with from fifty to two hundred broodmares in which there is no night-watchman provided to be on the alert during all the dark hours to render assistance and to call, if need be, a skilled hand for a critical operation. Of course, in nearly all such places, it is a rule for one or two men to sleep in the barn, but, in most instances, the one who is expected to awaken with every noise works as hard during all the day as any one else. There is little probability that such a watchman will be apprised by noises of more than half the occasions when aid is important. The true watchman should be awake continually while all others sleep. He, in turn, should have his rest during a part of the day, at least. This one item is particularly important during the long winter hours of darkness. Then there is the other serious matter of sudden changes in the weather, by which horses stabled at night and allowed the range of field and pasture during the day are affected. In the case of broodmares and young stock losses are too frequent because of colds and other ills resulting from thoughtless exposure in cold rains and strong winds. More than half the losses in such cases, too, are not in the actual death of animals but in a reduced condition of the young animals, by which their growth is stunted and their full after-maturity forever impaired. When it is considered that such defective animals are afterward used for breeding purposes and that their deficiencies are transmitted more or less to the offspring, the degeneration of a tribe of excellent animals may have its date in some apparently trivial neglect. It is, therefore, apparent to the reader that it is in the numerous little things in the handling of horses that one must be ever vigilant. The pennies must be cared for; the dimes need no care.

Rules of Registration.

WILLOW BROOK STOCK FARM,
WAVERLY, MORGAN COUNTY, IND.,
November 1, 1892.

THE records of the trotting and pacing horses are about closed for the year 1892, and add another year to our experience and development of a distinct breed of horses almost purely American.

We regard the progress made as highly satisfactory and encouraging. All speed records have been lowered, and the individual excellence of the horses has been much improved, and the interest in the industry broadened and increased, not only in our own country, but extended to every civilized nation in the world, and the world must get its supply from America.

With so extensive a market, and the vast interests awakened, we should make no mistakes but foster and encourage this great industry.

Digitized by Google

The most desirable breeding animals' › still advancing in price. A large per ıt. of the less successful and unprom- ng are shrinking in price, and we must ›k the situation squarely in the face. ıere is going to be a process of thin- ıg out. In addition to this depres- ›n, the uncertainty of the rules that vern the right to registration has, at esent, a very unfavorable and dis- ıraging influence. The fact that the les may be changed suddenly, without ir warning, produces doubt and uncer- nty as to the future, which can and ould be remedied.

That the best interest of breeders will best served by improving the rules is sure and certain as progress is made in e development of the breed, which is ing done. But the change should not made suddenly and without due no- :e. The writer is very firmly of the ›inion that should the proper authori- ›s adopt something like the following solution, to be irrepealable, to-wit: *Resolved*, That any change in the fore- ›ing rules of registration shall not ke effect and be in force until one year ter their adoption, and publication in 'ALLACE'S MONTHLY," this would re- ove doubt and uncertainty and give as- ırance to those in the business, and es- ›cially those who are beginning or in- nd to engage in the business. The :eeding of horses takes years to estab- sh, and even to get a start, unless you :e a millionaire. And when a breeder as determined on a certain line of reeding that will take years to consum- ıate he does not wish to be continually nbarrassed with the thought, the rules ıay be suddenly changed, barring all ıy young things from registration with- ıt notice, destroying all my labor and ıpectations.

This uncertainty and fear at present is n incubus and dead weight to the busi- ess, and is unnecessary; it only does arm. Let the proper authority pass ıch a resolution, giving stability and an ssurance that there will be no hasty ac- ion or snap judgment where such an im- ıense interest is involved, but will act with ıe deliberation, giving due and timely otice of any change to be made in the ules regulating registration, and it will give a great impetus to our business and remove a cloud of doubt and uncertainty now hanging over it. The vast investment in the business should not be continually menaced by the uncertainty or liability to sudden change in the rules regulating registration. Respectfully yours, E. A. OLLEMAN.

One Method of Educating.

EARLY last winter the writer had a high-bred filly coming two years old from the farm on board the cars with two other colts. They all had the distemper and came near dying. They actually staggered, they were so thin and poor. The filly, a standard-bred, having four inbred crosses to Hambletonian 10, bottomed by a thoroughbred foundation as rich as can be found in the stud book back to the seventeenth dam, is an exceedingly high-strung, beautifully finished animal. She has only been cleverly broken to the halter.

We put her in our home barn and ordered that she be fed on ground feed, with now and then a warm bran mash seasoned with salt and a handful of oil meal which served as dessert and pie for the poor thing. Of course prairie hay was always at its command, with plenty of fresh, pure well water and a good bed. It took four weeks to exterminate the vermin it brought by applying kerosene and lard to its head, neck, shoulders and along its back. The warm days of early spring in the sunshine and its daily nips of grass on the door yard lawn soon caused its shaggy coat of hair to drop from that part anointed and it was a sorry sight. But a pan of skimmed milk morning and evening with good feed as above outlined soon began to make a radical change in her entire being. To speak after the manner of men she became exceedingly cranky. It was not possible to curry or brush it at all unless securely fastened by the head, and then it was dangerous to be near it, as it would bite, strike and kick at the least touch of the card or brush. Sometimes two attendants could partially clean its body and mane, but when it came to touching its legs, feet or tail the trouble commenced. Its habit was to turn "tail to" constantly, unless it was

Digitized by Google

tied up securely, and like a wild horse or hog its head was always on the wrong end. The more it throve the more touchy it became, until the boys declared they could not curry it or wash its tail at all. It soon became to be a pitiable sight to behold from the filth it carried around on its tail and hind legs. Finally the "old man" said to the boys one morning, "that filly is too valuable to be allowed to go any longer in that sad-looking plight, and something must be done to change matters." By this time the female members of the family had become disgusted with its looks and actions and almost hated it. The boys hated it, and had not an old, experienced head been around, possibly a Nancy Hanks or a Leopard Rose would have been buried in oblivion after having been bred and raised to training age. We said to the boys on this particular morning: "We will stay at home this forenoon and try and help you educate Elysium." He looked up in utter surprise and says: "Educate her? She will educate you, I guess, before you have taught her the first three letters." Our reply was, "We shall see what we shall see," for we had been there many times before, twenty years ago. The lesson was carefully mapped out in advance, namely: She must first be tied securely to her large box stall and was to be given a thorough bath, with castile soap, a little ammonia and warm water, and plenty of it. The necessary straps to manipulate her were carefully prepared in the start and the lesson was begun by washing her neck and shoulders very carefully at first with a good-sized sponge, well filled with the soap and water. Gradually we worked toward her head and ears, when trouble began in a lively manner. Then the front foot was carefully tied up very securely and a kindly patting and conversation was carried on to let her know she was not to be hurt. We soon washed her head all around, but the ears and top of the head was forbidden us entirely. She reared, snorted and plunged to the best of her ability for a few minutes, when the boy said: "Well, I guess she is too much for us, don't you think so?" Our reply was, "Why no, she will be perfectly docile in less than sixty minutes and we can wash her all over from head to feet. He said, "If you wash her hind legs and tail in a week, I will miss my guess." After she became a little tired from having one foot tied up, we let it down very carefully, first buckling a strap around the pastern with a ring in it into which a long strap was buckled. This foot let down we rubbed the leg carefully all the time patting her where we could. Then a strong surcingle with saddle pad and rings was buckled tightly around the girth. This done she was untied, the long strap passed through the ring at the back and the other front leg was fastened up securely. Instructions were then given my boy to take her by the halter and we pulled forward as if to lead her, when we instantly had the off fore leg doubled up to her body and a shir made to the girth which held it there. Well, we had a few lively rounds by her rearing and plunging when she rested upon her front knees in straw a foot deep. Instantly her head was pulled upward and her hind parts pushed over and she laid upon her side our easy victim. Within half a minute she made the desperate struggle of her life to regain her feet, but was held securely there by keeping her head and neck turned upward and one sitting upon her hips. Three times within ten minutes did she struggle while we constantly patted, rubbed and talked to her kindly. The sweat broke out profusely, and her eyes shot forth fire almost. Not wishing to injure her constitution, we then carefully loosened the straps, and bade her get up with a gentle patting about the nose, head and ears. She did not think she could get up, or do anything, after her third struggle, neither would she try, without bidding. When upon her feet the washing went on all right, until the back part of her rump was neared. We immediately put up one fore leg. Again the washing went gently on until the tail and hind legs were interfered with, when she determined to conquer us. Immediately she was laid down again, as carefully as before, and she as vigorously protested and tried to get up. We could see that after her desperate attempt at this time

Digitized by Google

she gave up the fight, and we rubbed her gently all over and patted her, handled her legs and feet quite carelessly, always taking care to keep her in our power, should she attempt to get up.

In another ten minutes the lesson was imparted as kindly as if she had been a dear child, and it was learned as cheerfully, yet with many a struggle. We let her up, and our solemn word for it, Elysium was bathed from head to feet, all over, and it was only necessary to hold up a front foot two or three times to accomplish it, and that was only a safeguard, fearing she might attempt to kick. Thirty minutes did the business, and Elysium was immediately ingratiated into the affections of the whole family, as from that hour there was no more turning away from her attendants, but, upon being spoken to, would instantly come to be either fed, hugged or petted. We have had many nervous ones to deal with, but this one was an exception.

We consider this a very promising and valuable filly, and she is phenomenally speedy, but, rather than have subjected her first education to the ordinary professional colt breaker we would have preferred that a twenty-two calibre drop her in her tracks untouched.

Nature has endowed our speediest trotters with an excessive amount of nerve force, which, if properly matured and bottled up, will be of invaluable service in winning hard-fought races in long-drawn contests, or it can be ruined and only a wreck left to the owner in a few short lessons by an inhuman breaker that has less brains than the subject in hand.—*Iowa Turf.*

The Champion Stallions.

As the prominent question to-day is the stallion championship, the honor for which has been so grandly fought for by Kremlin and Stamboul, it will be in order to note how the champion records were made from the time when Ethan Allen astonished the horsemen of his day by trotting in 2:28, being the first stallion to go into the 2:30 list. This champion son of Vermont Black Hawk made his record of 2:28 in a match of $2,000 with George M. Patchen, the latter going to wagon. Ethan Allen distanced his antagonist in the first heat in 2:28. The event took place at the Union course, L. I., October 28, 1858. Two years later he reduced his record to 2:25¼, but in the meantime George M. Patchen had passed him in the race for the championship.

George M. Patchen, on August 2, 1860, made his best record of 2:23½ at Union course, L. I., in a race with Flora Temple. He won the first heat in that time, Flora winning the next three heats and race. Strange to relate this time remained the stallion record for eight years.

On July 29, 1868, at Buffalo, N. Y., the chestnut stallion, Fearnaught, cut the record to 2:23¼. This was not much of a break, nor did he retain championship honors long. He made his record in a race for a purse of $10,000, and won in the first, third and fourth heats in 2:23¼, 2:24¾ and 2:26¼. George Palmer won the second heat in the slow time of 2:28, and Col. Maynard, American Girl, J. J. Bradley, Myron Perry, Victor Hugo and Molly were the other starters.

Less than three months later the greatest speed-producing stallion of the age (except his own sire), George Wilkes, won the crown by making a record of 2:22. Although the mighty Dexter in 1867 had placed the regular trotting record at 2:17¼, no stallion beat George Wilkes' record of 2:22 till August 7, 1872, when Jay Gould made his mark of 2:21½, though a year previously he had tied it in 2:22.

Two years later, at the same track, the mighty Smuggler won the stallion record, which he held, with the exception of two months, for nearly ten years, the longest reign of any of the stallion kings. On August 5, 1874, at Buffalo, this royal son of Blanco made a record of 2:20¾. He won the first and second heats in a $10,000 purse in 2:22¼ and 2:20¾, Thomas Jefferson winning the race. At Rochester, August 13, Mambrino Gift, by Mambrino Pilot, dam by Pilot, Jr., won first money in the 2:26 class in straight heats of 2:21, 2:20 and 2:23, with a field of five behind him. He did not long retain his honors, however, as on September 15, at Mystic Park, Boston, Smuggler tied him in 2:20, winning the $10,000 stallion champion purse. July 15, 1876, at Belmont Park, Philadelphia, he defeated Judge Fullerton in 2:17½, 2:17 and 2:20. His fastest record of 2:15¼ was made August 31, 1876, at Hartford.

Phallas is the last of the stallion kings who obtained his champion record in a race and the first of the grandsons of Hambletonian to attain that honor. July 14, 1884, at Chicago, Ill., he defeated those three great campaigning mares, Catchfly, Clemmie G. and Fanny Witherspoon in 2:15¾, 2:16¾ and 2:13¾. After a lapse of eight years the record was then reduced from 2:15¼ to 2:13¾.

Maxey Cobb, 2:13¼; Axtell, 2:12; Nelson, 2:10; Allerton, 2:09¼; Palo Alto, 2:08¾; Stamboul, 2:08; Kremlin, 2:07¾, the champions in succession from 1884 to the present date, have all made their records against time. Axtell has a race record of 2:14, Nelson of 2:13, Allerton of 2:13¼, Palo Alto of 2:13, Kremlin of 2:11½ and Stamboul, of 2:15, though in justice to the latter it must be said that had he had any race opportunities during the last three years he would have had a far faster race record.—*Spirit of the Times.*

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, DECEMBER, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9, 10 and 11, each.....$ 5.00
All in one order..... 40.00
INDEX DIGEST (of first 10 Volumes)..... 7.50

Sires of Five or More.

THE trotting season may be said to have been fairly over on November 15, although of course between that time and the close of the season there would naturally be a number of additions to the 2:30 list in California and a few other places where the climate is mild. Enough is known of the season's work, however, at the date named to form a fair estimate of what has been accomplished by the leading sires of the year. It would be idle in a publication of this character to take the space necessary for a presentation of the entire list of stallions whose get have entered the 2:30 trotting or the 2:25 pacing list in 1892. Last month a fairly accurate table of horses that were represented by standard performers to the number of three or more this season was given, and now this is followed by one showing what stallions have had five or more of their get become standard by performance during the season just closed. It appears from this table, which is given below, that the total number of sires having five or more of their get enter the list in 1892 is seventy-three.

Fifty of these have records.

Forty-five have records better than 2:30.

Seventeen have records better than 2:20.

Three have records better than 2:15.

One has a record better than 2:10.

This gives some idea of the part that developed sires play when the results of the season's trotting are tabulated so that no stallion that has not had five of his get become standard by performance this year is eligible to mention, and as quite a number of the horses in this list that do not have records are either dead or on the verge of the grave, it will be seen that not many years will elapse until the list will be practically composed entirely of horses with records showing them to have more than the average amount of speed. Of those without records which appear in the list below Belmont is dead, Dictator is on the verge of the grave, Electioneer is dead, Harold will hardly last another season, Landmark is dead, Victor Bismarck is impotent, and others are well along in years. On the other hand many of the sires with fast records belong to the younger generation of stallions, comparatively speaking among those which would come under this category being the following:

Name.	*Record.*	*Age.*	*No. in list in 1892.*

In analyzing the list of sires that have had five or more additions this season to their standard representatives, it will be found in addition to the facts already given that all but sixteen of them trace directly in the male line to Rysdyk's Hambletonian. Nineteen sires,

Digitized by Google

ke a still higher test, have had ten or nter the list this year and all but three se trace direct to Rysdyk's Hamble-. Here is the male line breeding of nineteen stallions:

n are sons of George Wilkes.

ree are sons of Rysdyk's Hambletonian.

e is a son of Daniel Lambert.

e is a son of Kentucky Prince.

e is a son of Belmont.

e is a son of Mambrino Patchen.

e is a son of Happy Medium.

e is a son of Major Edsall.

From Hambletonian Dams.

"HARK COMSTOCK" calls attention in his usual forcible manner to the fact that this season's trotting has brought out in strong relief the greatness of stallions whose dams were by Rysdyk's Hambletonian. The wonderful potency of the Hambletonian family in the male line has been so long established and become so absolutely overwhelming as to create no comment, it being naturally expected when a world-beater of any age among the trotters puts in an appearance that such animal will trace direct in the male line to the "Hero of Chester," although there are of course numerous exceptions to this rule, as for instance one of the two horses, Stamboul and Kremlin, that have been fighting for the stallion championship this season. Stamboul, who on three occasions held the record for entire horses, is by Sultan, while Kremlin's sire is Lord Russell, a grandson of Hambletonian. But Stamboul's dam was by Hambletonian, and it is the universal testimony of all who have seen the California stallion that he is, in appearance, a typical Hambletonian, partaking in no measure, so far as looks are concerned, of the characteristics of his sire's family. Stamboul at ten years of age has ten representatives in the 2:30 trotting list, one of them, Murtha, being credited with a 2:18 performance, and the further certificate of good qualities in that she has trained on from a yearling to a six-year-old and improved her record every season. No horse has ever beaten the record as a sire made by Stamboul when ten years old, and only one, Sidney, that traces three times to Hambletonian, has equaled it. Kremlin is not only a grandson of Hambletonian in the male line, but his second dam is also by Hambletonian. Among the really sensational sires of 1892 is Wilton, that has put ten new ones in the list this year, among them a two-year-old trotter with a race record of 2:15¾ and a three-year-old pacer with a mark of 2:19. His four-year-old son, Moquette, divides the honors for that age with Alix, each having a record of 2:10. Wilton is not only out of a Hambletonian mare, but is inbred to Hambletonian,

Digitized by Google

as his sire was also a son of that horse. Looking hastily over the 2:30 list of 1892, including the horses that have reduced their records this season, it is found that the following prominent stallions out of Hambletonian mares are creditably represented. Of course there are many more, not well known as sires of 2:30 speed, that are also out of Hambletonian mares, but their standard representatives are not yet numerous enough to make them conspicuous.

The 2:15 Trotters of 1892.

SEVENTY-ONE trotters have entered the 2:15 list this season, making more than twice as many as were members of that distinguished group of performers previous to 1892. The explanation of this marvellous augmentation of the 2:15 list is the pneumatic-tire sulky, which came into general use by the time the season was well along. The new idea revolutionized trotting records, there is no chance for doubt on that point, and in some cases it made as much as six or eight seconds difference to a 2:20 trotter. There is no question that the absence of friction and the prevention of centrifugal motion, which are the most important features of the bicycle sulky, are an advantage to any trotter, no matter whether the speed of the animal be of the three-minute or 2:10 variety. Of course every man with a horse whose mark is better than 2:20 fondly imagines that in the case of his particular pet not much advantage is gained by the use of the new vehicle, but it is fair to assume, from what the present season has shown, that to the fastest trotters the "bike" is equal to a couple of seconds, perhaps more, although Mr. Doble says that one second is all that should be added to the 2:04 of Nancy Hanks, so far as the new-style sulky is concerned.

Of the seventy-one trotters that have entered the 2:15 list this season no less than forty-one are by sires with records, while the sires of thirty-five of them have records better than 2:30, and the sires of ten are in the 2:20 list. This is a good showing for the developed sires, especially when the matter is still further analyzed, because it then appears that the only stallions that have had more than two of their get enter the 2:15 trotting list this season are themselves the possessors of records which make them standard, these horses being Guy Wilkes, 2:15¼, with five new 2:15 performers this season; and Simmons, 2:28, with four. There are nine stallions that have had two or more of their get trot in 2:15 or better during 1892, and their names and breeding are matters of interest. Here they are:

Name.	*Record.*	*Sire.*	*New 2:15 Performers.*
Guy Wilkes	2:15¼	George Wilkes	5
Simmons	2:28	George Wilkes	4
Cyclone	2:28½	Caliban	2
Director	2:17	Dictator	2
Electioneer		Hambletonian 10	2
Hamlin's Almont	2:26	Almont	2
Pancoast	2:21¾	Woodford Mambrino	2
Patronage		Pancoast	2
Wilkes Boy	2:24½	George Wilkes	2

This is a phenomenal showing for the developed sires, as of the nine horses that have had two or more of their get enter the 2:15 list this year seven have records better than 2:30, while of the other two it may be said that Electioneer drew Marvin a quarter in thirty-four seconds, and Patronage is brother to Patron, 2:14¼, and Prodigal, 2:16. And speaking of Patronage, it will be noticed that his sire, Pancoast, is also represented in this table, they being the only sire and son thus honored. One-third of the sires in the list are by George Wilkes, that branch of the Hambletonian family being ever to the fore.

The list of trotters that have made records of 2:15 or better for the first time this season is as follows:

Name.	*Record.*	*Sire.*	*Record.*
Allie Wilkes	2:15	Red Wilkes	2:40
Aline	2:14½	Almont Boy	
Alabama	2:15	McCurdy's Hambletonian	2:27½

Walter E	2:11¾	Patchen Mambrino	
Wardwell	2:15	Hamlin's Almont	2:26

By the Records.

A MAN in Cleveland has compiled a list of all the stallions that have sired two or more trotters with records of 2:15 or better, and here is the result of his figures:

Sire.	Record.	No. in 2:15 List.	Average Speed.
Electioneer		5	2:10 9-10
Guy Wilkes	2:15¼	5	2:14 1-10
Alcyone	2:27	3	2:11
Simmons	2:28	3	2:12½
Director	2:17	3	2:11 5-6
Hamlin's Almont	2:26	3	2:13¾
Red Wilkes	2:40	3	2:14 5-12
Pancoast	2:21¾	3	2:13 7-12
Happy Medium	2:32½	2	2:08⅝
Dictator		2	2:11⅞
Wilkes Boy	2:24½	2	2:12¾
Patronage		2	2:11⅜
Cyclone	2:23½	2	2:12½
Abe Downing	2:20¾	2	2:14
Aberdeen	2:46	2	2:14¼
Startle	2:37	2	2:14⅝

This compilation is an exceedingly valuable one in its way, but there is one point, and in some respects a most important one, that has been overlooked. This is the age of the sires. It makes a good deal of difference—all the difference in the world—whether a horse has three or four in the 2:15 list at twelve or thirteen years of age, or whether he has the same number when twenty-five years old. Let us see how the matter figures out in this particular. Here are the ages of the stallions in the list, with their number in 2:15. It is evident that in a comparison of this sort age is everything. It cuts a most important figure whether a horse has two representatives in the 2:15 list at twelve years of age, as is the case with Patronage, or has the same number at the age of twenty-nine, which is the history, in this particular of Dictator and Happy Medium. Measured by the 2:15 list, Patronage is the equal of any horse of his years in the world, as he has two at the age of twelve. Guy Wilkes has just as many 2:15 representatives (five) as Electioneer, but he outranks the latter horse under this comparison by reason of the fact that he is only thirteen years old, while Electioneer, were he alive, would be twenty-four. Here is the list with the sires arranged in point of ages:

Name.	Age.	No. in 2:15 List.
Dictator	29	2
Happy Medium	29	2
Aberdeen	26	2
Startle	25	2
Electioneer	24	5
Hamlin's Almont	20	3
Red Wilkes	18	3
Abe Downing	17	2
Cyclone	16	2
Pancoast	15	3
Alcyone	15	3
Director	15	3
Simmons	13	3
Guy Wilkes	13	5
Wilkes Boy	12	2
Patronage	12	2

According to the age standard, which is the only true test of merit in a matter of this kind, Guy Wilkes is the greatest trotting sire in the world, and this is something that no thinking person can deny the truth of. Age considered, no other horse will bear comparison with Guy Wilkes, either as a sire of 2:30, 2:20 or 2:15 speed. That he is also breeding on in as grand fashion as his most ardent admirers could wish is proven by the fact that his son, Sable Wilkes, that was the three-year-old champion of his day, has since that time been the first stallion to sire a yearling trotter with a record better than 2:30; and that Sable Wilkes' performance in this respect was not a "scratch," is shown by the fact that his additions to the 2:30 list this season alone are six in number, two of them being two-year-olds with records respectively of 2:18½ and 2:21½, while two others are three-year-olds. Sable Wilkes was foaled in 1884, and at eight years he has nine in the 2:30 list, including a yearling and a two-year-old with a record better than 2:19. Is there any other eight-year-old stallion that can make such a showing of young trotters? Adding what Sable Wilkes has done as a trotter and a sire to what Guy Wilkes has accomplished in the same line, is there any doubt of the superiority of the last-named horse? This journal is not interested in any particular strain of blood. Its advertising columns do not dominate or guide the editorial utterances. What the MONTHLY

Digitized by Google

bases its arguments upon is the solid foundation made by the trotting records of each season. It is like whistling down the wind to argue against facts. They are irresistible.

A Great Trotting Inheritance.

ON the day that Stamboul set the stallion mark at 2:08½ his two-year-old daughter, Sweetwater, trotted over the same track in 2:26, and thus made standard by the performance of her get as well as by her own record the one-time four-year-old champion trotter, Manzanita, 2:16, a daughter of Electioneer.

This mile in 2:26 by Manzanita's daughter completes the second epoch in the history of a pair of trotting sisters—Manzanita and Wildflower—that were respectively the four and two-year-old champions of their day, Wildflower's mark when two years old being 2:21, and it stood for the better part of a decade as the fastest mile ever trotted by a horse of her age. The fact that both these mares, in addition to themselves being not only precocious colt trotters but the fastest in the world of their ages and day, have also demonstrated in the most conclusive manner that they are speed producers as well as speed possessors, is unusually gratifying to those who have maintained that from developed sires and dams must come the greatest percentage of trotting speed that can be produced, and as for the opportunities they have had Manzanita and Wildflower have accomplished even more in the way of speed production than could reasonably have been asked of them, something about the story of their lives will be of interest.

Twenty odd years ago there was trotting in California a mare known as Mayflower. She was a daughter of the pacing stallion, St. Clair, and inherited from that horse a tendency to pace when asked to go at speed. So well defined was this trait in the character of Mayflower that it was only by the use of excessively heavy shoes on her fore feet that the mare could be induced to trot. With this handicap, however, she made a record of 2:30½ as long ago as 1872, and was subsequently purchased by Senator Stanford, who had a fondness for the St. Clair blood. In the harem at Palo Alto Mayflower soon became distinguished as one of the greatest broodmares in the world when in 1881 her daughter Wildflower, by Electioneer, trotted a mile as a two-year-old in 2:21, a performance at that time so phenomenal that Budd Doble and other men of experience in trotting affairs who witnessed it were firm in the belief that it would never be excelled. Manzanita, a sister to Wildflower, was not so fast a two-year-old as the other daughter of Mayflower, but as a three-year-old she made a record of 2:23½, and at four years of age was one of the fastest and most beautifully gaited trotters ever seen, being one of the first of the get of Electioneer to impress beholders with the idea that the son of Hambletonian and Green Mountain Maid could get race nags as well as mere speed. Manzanita when four years old made a record of 2:16, and in addition to that performance being the best for a trotter of her age it was also, curiously enough, the first time that a trotter had gone into winter quarters with a record of exactly 2:16. Had not Mazanita subsequently broken down at a time when her flight of speed was greater than ever and denoted that she was certain to trot a mile close to 2:10, she would doubtless have been even at this day an equine star of even greater magnitude than is at present the case, as although she was the champion four-year-old of her day, her mark of 2:16 at that age has been so often beaten of late years that it no longer shines with the luster which surrounded it at the time of its being placed on the books.

But it was not alone through her two fast trotting daughters that the St. Clair mare Mayflower was destined to shine, because, when mated with the thoroughbred horse, Wildidle, she produced a filly called May, and from the union of this filly and Electioneer came the bay mare Idle May, foaled in 1885, that in 1891 trotted to a record of 2:27½. The old mare herself had produced a couple of record-breakers to the cover of Electioneer, but the intervention of a cross of thoroughbred blood, the resultant filly being then bred to Electioneer, as was her dam, does not seem to have improved the speed-producing capacity of the old mare's blood, although the power to produce trotting speed was still retained in grand proportions, as May is also the dam of Wild May, 2:30, as a four-year-old, by Electioneer. Another filly that came from the mating of Mayflower with Electioneer was Maybell, and to the cover of General Benton she produced Maralia, 2:24¼. It is evident therefore that the daughters of Mayflower that were sired respectively by the thoroughbred Wildidle and the trotting-bred stallion General Benton have done exceedingly well in the breeding ranks, but when compared with the achievements of two other daughters

Digitized by Google

of Mayflower—her champion trotters Wildflower and Manzanita—it is plain that the fillies of this old pacing mare which trotted the fastest are also producing in a much greater degree of excellence than are those which, so far as records show, do not possess much speed.

Wildflower, who made a two-year-old record of 2:21 in 1881, dropped her first foal in 1885. She produced regularly up to and including 1888, and here is the result:

Year.	*Produce.*	*Sire.*
1885	Wild Boy, *Sire of* Donchka (2) 2:25.	General Benton.
1886	Wildnut, *Sire of* Bedworth (2) 2:29¼.	Woodnut, 2:16½.
1887	Wildmont, 2:27¼,	Piedmont, 2:17¼.
1888	Wild Bee, 2:28,	Piedmont, 2:17¼.

This is a phenomenal showing, because from it appears the important fact that the first four foals of Wildflower have either trotted better than 2:30 or produced 2:30 speed, and of course this has been accomplished at an early age. In fact it is doubtful if any mare, circumstance considered, has a better record than Wildflower as a world-beating colt trotter and a uniform speed-producer, and if her history on the turf and in the breeding ranks does not point to and emphasize the value of developed speed in immediate ancestors we are at a loss to know what combination of facts could otherwise bring about that result. It is the practice of some writers to class Electioneer among undeveloped sires, but no matter how much hair-splitting there may be on this point, or under what circumstances a stallion may or may not be termed "developed," it is certain that Electioneer was a remarkably fast trotter, inasmuch as Mr. Charles Marvin has publicly testified to having driven him a quarter to a road cart in 34 seconds, a 2:16 gait. Electioneer's sire, Rysdyk's Hambletonian, was something of a trotter and when well along in years could pull a road wagon a strong 2:40 gait, as testified to by Mr. David Bonner, who frequently drove the horse. The dam of Electioneer was as fast a lot trotter as was ever seen in her day, and she in turn was by Harry Clay, a trotter with a record of 2:29. Starting, therefore, with the trotter Electioneer, each of whose parents was a trotter, and breeding to that horse the trotter Mayflower, 2:30½, the result was a couple of colt champions in Wildflower and Manzanita. It is also noticeable that the only trotters out of Mayflower that became standard by performance were sired by Electioneer, although the mare was also bred to the running stallion Wildidle and the trotting-bred horse General Benton and her daughters by those sires produced speed. Wildflower, however, when placed in the breeding ranks is represented either in performance or produce by every one of her first four foals, the eldest having seen the light in 1885.

Her sister Manzanita was not bred until later in life and her first mating resulted in the filly Sweetwater, that, as a two-year-old takes a record of 2:26. This filly's speed inheritance on her dam's side is, as has been shown, a remarkably continuous one and in the paternal line it is no less so, her sire being Stamboul, a horse that began his trotting career as a two-year-old and on successive occasions lowered his record until it now stands at 2:08, made at ten years of age. This alone would show that Stamboul's ability to trot is of the gradually improving kind and would naturally, even if there were no other attendant circumstances of probable potency in producing speed, have given him license to sire trotters. But aside from his own performances Stamboul is bred in trotting lines. His sire, Sultan, has a record of 2:24 and is by The Moor, 2:37, and out of Minnehaha, a fast trotting daughter of Steven's Bald Chief; second dam by Strader's C. M. Clay, record 2:35¼. Here are four generations of developed trotting speed in the male line alone of the filly by Stamboul and out of Manzanita: Stamboul, 2:08; Sultan, 2:24; The Moor, 2:37; and Strader's Clay, 2:35¼. Stamboul's dam was Fleetwing by Rysdyk's Hambletonian; second dam the fast trotting mare Patchen Maid, by George M. Patchen, 2:23¼. Fleetwing is also the dam of Ruby, 2:19¾, a sister to Stamboul.

There is an encyclopedia of information in this bald statement of eloquent facts. The great trotters of to-day are almost without exception bred in performing trotting lines, and the champion trotting stallions are getting early and extreme speed. This season a daughter of Nelson, 2:10, has made a record better than 2:25. Avena, a two-year-old daughter of Palo Alto, 2:08¾, recently trotting to a mark of 2:21½ in California. Stamboul, 2:08, has Murtha, 2:18, to his credit, and Kremlin, 2:07¾, will unquestionably be represented in the 2:30 list as soon as his produce are old enough to train.

To present, as it were, in a picture the facts above noted regarding the blood lines of Sweetwater, the tabulated pedigree of that filly is given herewith.

The 2:15 Pacers of 1892.

THERE is given below what is believed to be a fairly accurate list of the pacers that have made records of 2:15 or better in 1892. There are just half a hundred names in the list, the records ranging from 2:15 down to the 2:05¾ of Flying Jib, a horse that began the season without any mark. Like a good many others of the 2:15 pacers of 1892, Flying Jib is trotting-bred, being by Algona, a son of Almont; dam by Middletown; second dam a sister to the trotter Voltaire, 2:20¼. In fact of the nine pacers in the 2:15 list this season that have also beaten 2:10—Flying Jib, 2:05¾; Jay-Eye-See, 2:06¼; W. Wood, 2:07; Silkwood, 2:07½; Blue Sign, 2:08¼; Crawford, 2:09¾; Storm, 2:08½; Vinette, 2:09½; and Robert J., 2:09¾—all but one are by trotting-bred sires, the stallions which got W. Wood and Robert J. having trotting records respectively of 2:25¾ and 2:22¼. Jay-Eye-See is by a brother to Dexter, 2:17¼.

Twenty-six of the 2:15 or better pacers this season are by developed trotting sires, while only five are by developed pacing sires.

Of the twenty-three members of the 2:15 pacing list this season that have also made records of 2:12 or better, eleven are by the developed trotting sires Shadeland Onward, 2:18½; Gibralter, 2:21; Favorite Wilkes, 2:24½; Ensign, 2:28½; Guy Wilkes, 2:15½; Happy Medium, 2:32½; Montgomery, 2:21¼; Hartford, 2:22¼; Sultan, 2:24; Del Sur, 2:24, and Steinway, 2:25¾. The representative of Shadeland Onward is the champion two-year-old pacer, Online, record 2:11, and this trotting-bred trotter Shadeland Onward has also given us the champion yearling pacer in Belle Acton, 2:20, although it is only fair to say, in speaking of this filly, that her dam is the pacer Lottie P., 2:17¼, while the dam of Online is by Chester Chief, son of Rysdyk's Hambletonian. In addition to the stallions with records of 2:30 or better, mentioned as the sires of pacers that have entered the 2:15 list this season and also beaten 2:12, Happy Medium, 2:32½, should not be forgotten, as he is the sire of Riley Medium, 2:10½. In reading this list of 2:15 pacers for 1892 one can not but be impressed with the overwhelming preponderance of trotting blood in the sires of these horses, and the production of extreme pacing speed by stallions of trotting lineage is something that can not well be overlooked. The list is as follows:

Guard the Trotting Stakes.

There is no doubt that the numerous failures among trotting tracks this season, every one of which was due to the fact that big purses were attempted to be given in out-of-the-way places, will result in the associations which have been managed conservatively doing a bigger business next year than ever before.

Horse owners have found that it is a waste of time and money to cart their stables to the ends of the earth when the chances are that if the meeting loses any money the local management will either decline to settle or in some other way act to the detriment of visiting patrons. It was announced with a great flourish of trumpets that the November meeting at Birmingham, Ala., would be a grand affair in its way, but it turned out to be a fizzle. Horsemen from all parts of the country were attracted by reason of the inducements offered in stakes and purses, but after reaching there a great many of them found that events of all kinds had been closed and opened again at the whim of the management and without notice to the nominators, so that men who supposed that their horses were engaged found them without a chance to trot.

Another characteristic move by the management was that in several instances after two payments had been made in a stake the same had been declared off, and on an entirely different basis reopened for $300 instead of the original amount, $1,000. It is no wonder that a good many men are becoming tired of buying trotters when such mismanagement, carelessness, and is some instances downright swindling as has marked the campaign of 1892, is prevalent. It is all well enough to say that "Wild Cat" Jones of Columbia, the people at Richmond, Ind., the Des Moines, Iowa boomers and others who ran meetings where only a portion of the purses was paid, are merely exceptions to the general rule of honesty which prevails on trotting tracks, but the truth of the matter is that such "exceptions" are far more numerous than they should be. It is only the notable instances of "welching" of trotting tracks this season that have come before the general public, there being a number of cases in which the swindling was of such small amount as to make it unwise for horsemen to bother about the matter. If trotting is to be conducted as it should be, if men who make entries, sometimes months in advance, are to have their interests protected; if, in short, the business is to be guarded against the attacks of charlatans and thieves, the prime point of defense must be proper supervision of the stake money and entrance fees.

The only way in which these funds can be properly and positively secured is to have them deposited with the parent association to which the track belongs; and, if horse owners and breeders are alive to their own interests, they will see to it that during the present winter legislation to this effect is proposed to the National and American Trotting associations. It is legislation of a sort to which no honest track owner or manager can object, and it is

Digitized by Google

the only proper method of protecting nominators in stakes and purses. The idea that under the present system which governs the trotting turf a little whiffit of a sneak-thief such as Columbia Jones has shown himself to be is enabled to lay hands on and put out of sight more than $30,000 of trust funds given into his charge by horsemen in all parts of the country, is preposterous and disgraceful. Mr. Jones' place is in the penitentiary, where other embezzlers go, and if he is not put there it will be because those who have suffered losses through his thievery do not take concerted action in the matter, because it is not possible that the laws of Tennessee are powerless to punish a man of his character and achievements in dishonesty. The National and American Trotting associations are institutions in which every breeder and horseman has confidence. They are not private enterprises, and are not managed with a view of making money for one man or an association composed of only a few citizens. They enact and enforce laws for the government of the trotting turf, and it would be entirely proper to make them the depository of trust funds in trotting stakes and purses. If the making of laws looking to this end is proposed there will doubtless be opposition from some sources, but such opposition will be a confession of weakness—it will be as the shrinking of one who fears to have an ulcer probed. Every trotting stake or purse with advance payments that is projected from this time forth should have something more substantial behind it than the guarantee of an individual or a race track. The past of the trotting-stake system is already tinged with dishonor, but there is no reason why the future may not be kept untarnished.

A High Standard.

DURING the trotting season just closed fifty-six stallions have had two or more of their get enter the 2:20 list, and when the results of the campaign of 1892 in this direction are tabulated many facts of value and interest are brought to the surface.

It is found, to begin with, that in this list are three stallions less than ten years of age, and as the standard of admission is a very high one, it is all the more creditable that three such young horses as Acolyte, eight years; Chimes, eight years; and Shadeland Onward, nine years, should be found within its precincts. Every one of these horses, it will be noticed has a record, that of Chimes being the slowest, and the average of their marks is 2:23¼. All these horses trace directly in the male line to Rysdyk's Hambletonian, two of them being grandsons of George Wilkes and one a son of Electioneer. Acolyte is inbred to Hambletonian, his dam being by Almont; second dam by Mambrino Chief. The dam of Shadeland Onward is by Mambrino Time, a grandson of Mambrino Chief, and the dam of Chimes is by The Moor, a Clay horse; so that in the near crosses of the pedigrees of this trio of notable young sires the most prominent strains are those of Hambletonian, Mambrino Chief and C. M. Clay Jr. 20.

The stallions that have had five or more of their get enter the 2:20 list this year are:

Name.	*Record.*	*No. in List.*
Onward	2:25¼	10
Electioneer		8
Red Wilkes	2:40	7
Pilot Medium		6
Alcantara	2:23	5
Alcyone	2:27	5
Dexter Prince		5
Happy Medium	2:32½	5
Robert McGregor	2:17½	5
Hamlin's Almont	2:26	5

Under the 2:20 standard, when the time is limited to the trotting season of 1892, Onward makes by far the best showing of any horse in the list, and his work is a brilliant illustration of the almost uniform success that has attended the blending of the Hambletonian and Mambrino Chief strains of blood. In the matter of highest average speed production for 1892 among these sires, the first horse is the trotter Shadeland Onward, whose record is 2:18½, and whose sire and grandsire—Onward and George Wilkes—are also in the 2:30 list. Although Shadeland Onward is but nine years of age he had a phenomenal representative this season in the champion two-year-old pacer Online, whose record is 2:11, while another pacing son made a record of 2:14¼. Next to Shadeland Onward in this matter of extreme speed production comes Lord Russell, the brother to Maud S., 2:08¾. He had two of his get enter the 2:20 list this year, they being the four-year-old colt Lee Russell, 2:18¼, and the grand five-year-old stallion Kremlin, 2:07¾, who is a champion among entire horses of his age, and who stands next to Stamboul in the race for the stallion championship, being beaten only a quarter of a second by the California horse, and barred by lack of good weather from the opportunities in the way of trials against the watch which finally enabled the son of Sultan to place the stallion where, so far as Kremlin is

Digitized by Google

concerned it must remain secure for the balance of this year. Lord Russell's two representatives are trotters in distinction to the two pacers which placed Shadeland Onward at the top of the tree this season for average speed production, but it should not be forgotten that Shadeland Onward is also the sire of the champion yearling pacer in Belle Acton, 2:20¾. The list is as follows:

Name.	*Record.*	*Age.*	*New 2:20 pfs.*	*Average Speed.*
Aberdeen	2:46	26	2	2:14½
Acolyte	2:21	8	2	2:18½

Notes and News.

It has often been made a matter of complimentary comment by the admirers of Stamboul when speaking of that horse that every season he was in training he reduced his record, beginning as a two-year-old and finally landing in the 2:07½ notch this year. That this quality of training-on is a valuable one in a trotter goes without saying, but it is doubly so in a stallion, evidencing as it does his great vitality. In the case of Stamboul it would seem from the performances of his first trotter, Murtha, that the training-on quality is to be transmitted to his get, and Murtha's performances are certainly remarkable for uniform improvement. She began in 1888 as a yearling, taking a record at Los Angeles, Cal., of 2:41¼ on December 8. In 1889 she trotted two races and won one of them, making a record of 2:40. In 1890 she started seven times, closing the season with a third heat record of 2:30. In 1891 this was reduced to to 2:25½, among her noteworthy performances being the winning of a six-heat race at Rockford, Ill., where she trotted the deciding mile in 2:26¼. This year she has reduced her record to 2:18 at Des Moines, Iowa, August 18—certainly a grand showing for a mare that has been trotted and trained ever since she was old enough to wear harness.

Among the deaths of men who are known in the ranks of trotting-horse breeders during the last month, the most notable are those of Mr. W. J. Gordon, of Cleveland, Ohio; D. J. Crouse, of Syracuse, N. Y., and "Uncle" Jack Hook, of Kentucky. Mr. Gordon, who was in the neighborhood of seventy years old at the time of his death, has been prominent as the owner of trotters for the last ten years, the most conspicuous members of his stable during that time being Clingstone, 2:14, and Guy, 2:10¾, both of which horses were purchased by him when their records were much slower than the rate of speed they ultimately attained. Mr. Gordon, also owned William H., 2:18½; Clemmie G., 2:15½, and others of less repute. After Clingstone had shown himself one of the grandest race-horse trotters in the world Mr. Gordon bought his sire, Rysdyk, and his dam, Gretchen, but subsequently disposed of them after breeding a brother to Clingstone that made a record of 2:29½ in 1890. Mr. D. J. Crouse was a gentleman of great wealth and although he did not campaign his horses prominently, was, nevertheless, at various times, the owner of a number of animals with records close to 2:20. His barn in Syracuse was unquestionably the finest structure of its kind in the world. Jack Hook was a driver of the old school, and his specialty in trotting blood was that of the stallion Cyclone, a horse to which he gave a record of 2:23½ many years ago. Mr. Hook brought out and drove to their records Dr. Sparks, Annorean and other prominent youngsters of the Cyclone

Digitized by Google

family. He was in his seventieth year at the time of his death and will be mourned by all who knew him, as he was a man of sterling qualities and rugged honesty.

ON November 18 Stamboul reduced the stallion record to 2:07½ over the kite track at Stockton. Two days previous he had made an unsuccessful attempt to lower his mark of 2:08, and only succeeded in placing 2:09¾ to his credit. On the 18th, however, it was evident that the rainy season, which puts an end to trotting on the Pacific coast, was at hand and the horse was rather hastily prepared for a fast mile. He went to the half-mile pole in 1:02¾ and finished as above stated in 2:07½, thereby giving himself the stallion championship, which up to that time had been held by Kremlin, 2:07¾. Stamboul is to be sold at auction in New York in the near future.

MR. MORRIS J. JONES, of the Standard Horse company, whose headquarters are at Kenosha, Wis., writes: "If the trotting campaign returns are all in we would like to announce our return home with the fastest trotting stallion in the state of Wisconsin (Pactolus, 2:12¾), and the fastest four-year-old mare in the world (Alix, 2:10), and think we own one of the two-minute trotters of 1893."

AT the recent National Horse show held in New York city the prize for broodmares with foal was given without question to the great producer Mabel L., that is now twelve years old and that is the dam of the following performers in 2:30 or better:

Reina (7)	2:13½
Judge Keeler (4)	2:25
Curfew (3)	2:28¼
Ruby (4)	2:28½
St. Regis (5)	2:29½

In addition to these representatives in the 2:30 list Mabel L. is also the dam of the yearling Salolo, that has a record of 2:53½, and of Reginia, 3:03 as a two-year-old. In a letter to a New York paper Mr. H. M. Littel, of Macedon, N. Y., says, regarding this great mare: "She dropped her first foal in 1883 and her eighth one this year. Six are by St. Arnaud, one by Chimes and one by Sunolo. She is now in foal to Ralph Wilkes, 2:13½. I think Beautiful Bells is the youngest broodmare with four in the 2:30 list. She was fifteen years of age at that time. The eight foals of Mabel L. are all trotters, and only an accident will stop all eight from having attained a record of 2:30 or better by the time their dam is fifteen years old. Although Mabel L. will drop a foal next year she has so much natural speed that I shall make a trial to give her a mark close to 2:25." There is no question that in a general way Mabel L. is as great a broodmare as has been produced, and for this reason it is of interest to know that her blood lines are of the proper kind, she being by the developed stallion Victor, 2:23, and out of a mare by Volunteer. Victor's sire was the trotter General Knox, 2:31½, and the breeding of his dam was unknown. It was the mating of this developed stallion by a developed sire with the daughter of the trotter Volunteer that produced a broodmare whose performances have been simply astonishing, and as the owner of Mabel L. says she has so much speed that he will have her trained next season and expects to give her a record of about 2:25, it is evident that her trot-producing qualities as a dam are due in some measure to her own inherited speed. More than this it appears that four of Mabel L.'s trotters are by the developed stallion St. Arnaud, 2:29¼, and that the other, the three-year-old filly Curfew, is by Chimes, 2:30¾ as a three-year-old. The success, then, of Mabel L. as a broodmare would logically appear due to the fact that she is a trotter herself, that her sire had a record of 2:23, and that her dam was by the trotter and sire of trotters, Volunteer, in addition to which her grandsire was the trotter and sire of trotters, Gen. Knox. So strongly trotting-bred a mare as Mabel L. and that herself inherited the trotting disposition to an extent which enables her to show better than a 2:30 gait should naturally produce speed, especially when bred to such horses as St. Arnaud (who is a son of George Wilkes and out of a mare by Mambrino Patchen) and the intensely trotting-bred trotter Chimes, son of Electioneer and Beautiful Bells.

A REMARKABLE incident occurred in Jessamine county the other day which, while almost impossible, is nevertheless true, remarks a Lexington, Ky., paper. L. C. Stedman, the real estate man of this city, had a mare and colt which he sent to Garrard county to be weaned. On the way to that county, and while crossing the covered bridge over the Kentucky river at Curley's distillery, the colt became frightened, jumped over the stone wall that guards the approach to the bridge and striking on the abutment was precipitated into the river, a distance of eighty feet below. Strange to relate the colt picked itself up, climbed out of the water, gave a vigorous shake of its body and trotted along after its mother as if nothing had happened.

Digitized by Google

ILAN, Italy, has a trotting track which is and a half furlongs in circumference. re is another track in the shape of the fig- 8, measuring one mile and a quarter, unners. A track of this shape was sug- ed years ago by the late W. H. Wilson for ess races.

OMEN who are fond of horses frequently e great power in controlling them, says a er in the San Francisco *Call*. I remember e visiting a large stock ranch and, going ugh the stables, saw in a boxstall a three- r-old colt who cowered in a corner as we roached and turned threatening heels upon "He had just been caught up," the pro- tor explained. "He hasn't had a halter ince he was a yearling and is very wild, ne of us can get near him." He drew a le nearer as he spoke, and the colt made a d plunge for the other side of the big stall. he stood facing me I walked quietly up to n and, though he trembled a little, laid my nd on his neck and in a minute or two he s rubbing an inquisitive nose along my eek while I softly scratched his tumbled ne. "Upon my word, now," said the own- "you ought to be a horse-trainer. Horses e women, and are almost always more gen- with them than with men. For this reason courageous woman might often succeed as a iner of saddle-horses for women's use.

THE filly Ella Woodline, that took a record 2:29¾ this season, is an instance of early velopment in parent and produce worth ting. She is by Woodline, that as a two- ar-old made a record of 2:28. He is by Nut- ood, 2:18¾, dam by Blackwood, 2:31. The ason that Woodline made a record of 2:28 a two-year-old he also got the filly that as now beaten 2:30 as a yearling. Woodline now four years old, and this season made a ord of 2:19¼. He is the only four-year-old, far as can be recalled, to have a representa- e in the 2:30 list and he is certainly the only llion of that age one of whose get has be- ome standard by performance as a yearling.

ELLERTON, 2:09¼, runs loose in a paddock t Independence every day and takes plenty exercise that way. Some of his weanlings already broken to harness and receive o and one-half miles of road work daily to rt. The only other item of interest from dependence just now is that C. W. Williams announced a great program for his trot- g meeting over the kite track next year. one feature being thirteen stakes of $5,000 each as follows: For yearling trotters, mile heats, two in three; for two-year-old trotters, mile heats, three in five; for three-year-old trotters, free-to-all class; for 2:30 trotters; for 2:25 pacers; for 2:20 trotters; for two-year-old trotters eligible to 2:50 class January 2, 1893; for pacers eligible to the 2:15 class January 2, 1893; for trotting stallions; for 2:15 trotters eligible January 2, 1893; for three-year-old trotters eligible to 2:20 class January 2, 1893; for free-to-all pacers.

THE great race mare Nelly Mason, who showed herself a trotter of the first water at the Lexington meeting by winning the fourth, fifth and sixth heats of her race in 2:14¾, 2:14, 2:14½, will not appear on the turf next season, as she has been bred to Norval, 2:14¾, and is supposed to be in foal. She is owned by Peter Truax, of Chippewa Falls, Wis.

A STATISTICIAN has been doing some elaborate figuring in regard to the breeding of the various horses that have been successful in the classic events on the English running turf for the last half century, and his conclusion is that developed sires have had by far the greatest success in the stud. He says that in fact nearly all the winners have been by such sires, but adds that mares which never raced have thrown nearly as much speed as those that were famous winners in their day. The trotting-horse breeders of this country are finding out very rapidly that it wont do to tie to pedigrees along where there is no speed attachment, and from what several mares with records better than 2:30 have already accomplished in the production of trotters it it would seem that in a short time the stallion without a standard record and the mare that has never shown any speed will be conspicuously absent from the breeding ranks.

TATTERSALLS IN AMERICA.

Its Accomplishments in the Past and its Aims for the Future.

NEW YORK, November 16.

EDITORS WALLACE'S MONTHLY:

KINDLY permit me the use of your columns for a statement which I will endeavor to make as concise and brief as possible, with reference to the organization known the world over as "Tattersalls."

The object of this statement is to show the extent and character of the business of the Tattersalls Companies in America, what ha-

Digitized by Google

been accomplished by them in the past, their plans for the future, and also to correct possible erroneous impressions resulting from biased reports emanating from interested and predjudiced sources.

When, in 1879, Mr. William Easton, the managing director of the companies in this country, arrived in New York, he found no adequate public sale structures here. The business was in its infancy, and conducted in a sort of hap-hazard manner alike unprofitable to the breeder and seller and unsatisfactory to the purchaser. The system of public sales originally inaugurated by the Tattersalls, and long in vogue in England—in fact the principal medium for the sale and purchase of turf horses (and, for that matter, of horses for all purposes)—was practically unknown and entirely misunderstood here, rendering the pioneer work of its inaugural discouraging in the extreme. But, with a perseverance worthy the results which have rewarded his efforts, Mr. Easton stood unfalteringly by his guns, battling a prejudice that was the result of lack of knowledge of the subject, until success fully as great as his fondest hopes pictured has been accomplished, and to-day it is safe to assert that ninety-nine one-hundredths of the transfers of blood stock are affected through the medium of public sales, the Tattersalls being far in the lead in these transactions.

The results show for themselves, and the breeders of thoroughbreds in this country have attained a prosperity that could not have been attained for years to come but for the persistent efforts of Mr. Easton, backed by the confidence in him and the capital of his company, which has been so munificently furnished for the purpose. American capital was not available, nor could it be obtained, because the risk was thought to be very great at best and the business entirely misunderstood by our capitalists. It is safe to say that the enormous investments in this country by the Tattersalls, aggregating close to $1,000,000, have, as yet, been comparatively non-productive and resulted much less in profit to the organization than to the advantage of the breeders of America. In fact it is not unreasonable to claim that the present prosperity of the thoroughbred breeders and the greatly-increased value in running stock are largely indebted to the activity brought about by the state of affairs resulting from the efforts of Mr. Easton.

That being true of the blood horse interests, why, in a measure at least, will not the same course inure to the benefit of trotting-horse interests? Can the expenditure of a vast sum of money in erecting and furnishing convenient and perfect marts—almost palaces—for the economical and successful sale of the products of American trotting-horse breeders, at the different points most advantageously located in the country, fail to result in advantages and profit to both the producer and the purchaser?

The progressive breeder has long since become convinced that the system of public sales is the true one for the transfer of their products. Then the public—that infallible appraiser of values—puts the stamp of merit where merit exists or the brand of failure where it is deserved. The breeder, if not blindly prejudiced, at once ascertains his true standing in the business and profits by the experience. If his stock is not of the character which finds public favor and consequent high prices, the remedy is obvious, if bitter—to get rid of it for what it will bring and secure in its stead that which will sell for good prices.

Year by year has the system become more and more popular. Farms that have heretofore depended entirely on private sales discover one by one that public sales, by their popularity, have almost revolutionized that important branch of the business, and fall into the ranks of those who patronize them, convinced that the sale ring is the most convenient, profitable, satisfactory and certain method for disposing of their stock.

Realizing the value of these facts to the trotting-horse breeders of the country, Mr. Easton conceived the idea of establishing a chain or circuit of sales at points having natural advantages, which would more perfectly meet their wants, and enable them to conveniently give the most extended distribution of their animals, and at the same time affording buyers the opportunity for purchasing different desired strains of blood without the loss of time, the expense, and the annoyance incident to long trips in search of it.

The capital required was enormous; immediate profitable returns on the immense outlay was hardly to be expected, but his company furnished it, and it is a fact that today it is the only organization making public sales a business, that own a building or have one dollar invested in property used for the purpose.

Although foreign capital to a large extent,

Digitized by Google

capital which will bring more profit to the erican breeder than the foreign investor. d not only that, but American managers— n who have been identified with and in- sted in the American trotter—have already n selected for the trotting department.

Now for results: In New York the sale ository, corner Seventh avenue and Fifty- h street, is an ideal building for the pur- e—convenient, roomy, clean; every detail naged with clock-like system. In addition this repository, the company has at Hunt's int—a suburb of the city—another large e building, extensive paddocks and a aightaway covered track will either be structed there or another site chosen for purpose.

In Chicago the whole block fronting on arborn street, and extending from Sixteenth Seventeenth streets, practically in the busi- ss center of the city, has been purchased, on ich is erected an immense structure nearing mpletion, covering the entire property. It ndoubtedly the most costly and extensive ifice of its kind in the world. The well- own and respected gentleman, Col. R. E. monson, of Kentucky, has been appointed sident manager and assistant auctioneer.

In Lexington, Ky., the Horse Exchange of asfield & Co., with the good will of the busi- ss, has been purchased, and a new building ected for the sale ring proper, heated by am and lighted by electricity. It is as near rfect as experience can make it. Mr. W. Brasfield, the senior member of the old mpany, and a gentleman universally ad- red for his sterling honor and correct busi- ss methods, is retained as resident anager.

In Cleveland, Ohio, the business and good ill of Emery & Fasig, and the building, which s been pronounced the most perfect sale ructure in America—have been secured. The ilding will be improved by electric lights.

As auctioneers Mr. William Easton and Col. . E. Edmonson are without rivals, the ac- nowledged best talent in the country, which ill be devoted exclusively to the business of e Tattersalls Companies.

In the employ will be found Mr. R. G. estmore, for many years on the *Turf, Field d Farm*, and recognized as authority on both oroughbred and trotting pedigrees, besides merous other assistants—five being em- oyed from the city of Lexington, Ky., ne—all of whom excel in their different functions, and their services will greatly add to the efficiency of the organization.

The pay roll for its staff, office assistants, etc., amounts annually to $50,000, and about $75,000 is spent yearly for advertising. These figures enable one to form some conception of the magnitude of the business.

The writer has been retained as manager of the trotting department, and, if his ability will only keep step with his aims and desires, the interests of all concerned will be protected.

The earnest endeavor has been made to systematize, unite, concentrate and harmonize interests, which by acting in unison and "pulling together" can not fail in producing the best results to the breeders of the country. There is no denying the fact that the competition incident to conflicting interests of different sale firms often resulted in detriment to consignors. By harmonizing these conflicting and, to sellers, detrimental elements, the true interests of the breeder is subserved.

The foregoing facts speak for themselves, and it simply remains for the breeders, owners and buyers, too, to put their own unprejudiced appraisal on the value of the efforts and purposes of the Tattersalls' Companies in America.

Most respectfully,

WM. B. FASIG, Manager
Trotting Department, Tattersalls.

TERRE HAUTE, IND., Nov. 19, 1892.

EDITOR WALLACE'S MONTHLY.

GENTLEMEN: Will you do me the favor to announce to the public in your next issue that the date of the close of the entries to the Terre Haute Purse $10,000 for foals of 1892 to trot in 1894 as two-year-olds, has been postponed from December 1st, prox., to January 15, 1893.

For some time until now the public mind has been more or less engrossed in politics, and in closing the entries December 1st it would have been difficult to have efficiently called the nominators' attention to this event, and for this reason the Society deemed it best to postpone the closing date as above indicated.

Our meeting in 1894 promises to be a very important one; our four-year-old Futurity, with five semi-annual payments, now has in some $17,950, and the three-year-old, with four semi-annual payments, has in at present some $9,500, and these, with the two-year-old of $10,000 (if the latter fills, as I have no doubt

Digitized by Google

it will) will form a nucleus for a grand meeting in 1894. We expect that these three events will award to the horses that compete in them the very handsome sum of more than $40,000, including the sums set aside for the breeders and drivers of the winners. What other association can show three such plums to be trotted for at one meeting in that year or any other?

The amounts received and to be received to the Terre Haute Futurities are held in trust by trustees, and have never gone into the society's treasury, and are so conservatively invested that they could be converted into cash on twenty-four hours' notice at any time, and they will remain in the same hands until the week of the meeting, when they will be promptly forthcoming to those fortunate enough to win them over the great Terre Haute track. Yours very respectfully,

CHARLES C. OAKEY,
Secretary Vigo Agricultural Society.

The Index Digest.

WE again call special attention to The Index Digest—an index of all standard and non-standard horses registered in the first ten volumes of Wallace's American Trotting Register, giving the name and number of all stallions, name and number of sire, dam and sire of dam, with complete reference to the volume in which they are registered. Mares and geldings are treated in the same general comprehensive manner.

This work will prove a valuable addition to the volumes of the Register, without which no set is complete. To such persons as can not afford a complete set of the Register, but merely wish to ascertain whether an animal is registered, or only desire the initial part of the pedigree, it is invaluable.

Bound in uniform size and style with the Register. Price $7.50, postpaid.

Few breeders who have seen this work have failed to purchase, and that it is highly appreciated by the public there is no doubt. The following is a sample of the many letters received:

THE SOUTHERN BREEDING STABLES,
ALBIA, IOWA, November 23, 1892.

American Trotting Register Association,
Chicago, Ill.:

I have just received the Index Digest, and must say it is unquestionably the greatest of all books for horsemen, and I am more than pleased with it. Yours truly,

W. B. GRIFFIN.

Questions and Replies.

SUBSCRIBER.—In whose name as owner does Investigator, 5432, stand in the records?

ANSWER.—Registered in Volume VI as the property of Powell Bros., Shadeland Stock Farm, Springboro, Pa.

A. W. A., RICHMOND, VA.—1. What do you consider fashionable breeding, and what horse can you cite as a typical fashionably-bred trotting horse? 2. How does Happy Medium rank as a sire? 3. Is not Hambletonian, 10, the father of all the great ones?

ANSWER.—1. A fashionably-bred trotting horse is one whose ancestors on both sides are of successful producing and prepotent blood; of such breeding that his services and progeny meet with ready sale at high prices; are always in demand by the most intelligent and liberal buyers, hence fashionable. It would be invidious to select one from the large number of typically bred fashionable stallions and give his name to the exclusion of others equally as well bred. 2. As one of the most prepotent and successful trotting sires. 3. No, while a large majority of successful trotting sires are either sons of Hambletonian, 10, or trace to him in direct lines, there are several notable exceptions.

A. V. H., TENAFLY, N. J.—Can you or any of your readers give me information in regard to a mare called "Flora Page" said to be by Judge Brigham? It is alleged this mare trotted a trial at Chicago some years since in 2:28.

ANSWER.—Know nothing of the mare Flora Page; there is no record of any performance or trial by her that we can find. Shall be glad to publish any information concerning her furnished by our subscribers or readers.

Some New Advertisers.

THE great trotting sales by Tattersalls of America are set forth in a full-page advertisement in this week's issue, and the extent and scope of the enterprise fully detailed by the able pen of William B. Fasig, manager trotting department. Read the advertisement and the article.

AN old advertiser, George H. Stahl, Quincy, Ill., again calls attention to his Excelsior Incubator for hatching chickens by steam, and William Stahl, Quincy, Ill., renews his advice to "Spray your fruit trees and vines."

THE Standard Trotting Horse company of Kenosha, Wis., have changed the text of their

Digitized by Google

advertisement to suit the successful performances of their horses in 1892. Pactolus, by Patronage, has reduced his record of 2:22½ to 2:12¾ at five years old, and is now the fastest trotting stallion in the state of Wisconsin; and Alix, also by Patronage, has reduced her three-year-old record of 2:16¾ to 2:10 and is now the fastest four-year-old mare in the world by the record, and, jointly with Moquette, holds the champion four-year trotting record. The motto of the farm is "Fashion follows speed."

THE Lomo Alto farm, Henry Exall proprietor, Dallas, Tex., is one of the youngest yet most prominent breeding establishments of that great State. The premier stallion, Electrite 10878, is a magnificent bay horse, fifteen and three-fourths hands high in front and sixteen hands behind, has magnificent shoulders and great driving power, particularly heavy quarters and stifles, a perfectly gaited line trotter and very speedy, fine about the head and neck as a thoroughbred, with a very attractive eye and countenance. His owner intends training the horse during 1893, and is confident that he can secure as low a mark as his full brothers, Sphinx, 2:20½, or Egotist, 2:22½. His breeding is gilt edged, by Electioneer; dam Sprite, by Belmont; second dam Waterwitch, by Pilot Jr. Tallmage 4094, is the other stallion at Lomo Alto farm; he has a record of 2:30½, and is by Byerly's Abdallah; dam by Strader's C. M. Clay Jr.; second dam by Pilot Jr.; third dam Mary, by Monmouth Eclipse. Read the advertisement for full particulars.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ALIDE WILKES, (6) bl m foaled 1888; by Black Wilkes 3541; dam Alide (dam of *Winslow Wilkes*, 2:09¾), by Almont 33; g d Jenny, by Texas (Offutt's), son of Texas (Gaine's). [See Alide, Vol. XI.] Bred by N. I. D. Solomon; passed to Charles E. Barnum, Omaha, Neb.; then to Thomas M. Marshall Jr., Pittsburg, Pa.; then to J. T. Fargason, Memphis, Tenn. [Vol. XII.]

BERTHA LINN (7) dn m foaled 1891; by Western Boy 4559; dam June, by Creole 5531. Bred by Ed Lawrence; passed to Frank Vancleave, New Market, Ind. [Vol. XII.]

BETTY ABDALLAH (7) br m foaled 1891; by Orchestra 1414; dam Bet, by Toronto Abdallah 4568; g d Bet, pedigree not traced. Bred by Charles S. Dayton; passed to James M. Strong, East Hampton, N. Y. [Vol. XII.]

CAP-A-PIE 20591, (6) bl h foaled 1891; by Lexington 8579; dam Betsey G. (dam of The President, 2:36¾), by Almont Sentinel 6054; g d Penelope, by Alburn 4270, etc. [See Betsey G., Vol. IX.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

CLAYMORE 19964 (1, 6) bl h foaled 1889; by King Clay 594; dam Time-Enough, by Mambrino Time 1686; g d Katie M., by Leo, son of Texas. [See Time Enough.] Bred by P. P. Johnston, Lexington, Ky. Record 2:28½. [Vol. XII.

DEIDAMIA D., (7) br m foaled 1892; by Harkaway 2875; dam Maud Sprague, by Kentucky Sprague 3435; g d Anna E., by Star Eagle (Harris & Bright's); g g d Betts, by Joe Stoner, son of Wagoner. Bred by Thomas A. Doram, Danville, Ky. [Vol. XII.]

DORADO, (6) br m foaled 1891; by Clay King 2964; dam Alice Brouham, by Mambrino Time 1686; g d Gretchen's Daughter, by *Fisher*; g g d Gretchen (dam of Romero, 2:19½; Del Sur, 2:24, etc.), by Mambrino Pilot 29, etc. [See Alice Brouham Vol. VII.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

EXECUTIVE 20874, (6) b h foaled 1892; by Alcantara 729; dam Stray Moments, by Nutwood 600; g d Totsey (dam of Wyatt, 2:27), by Mambrino Transport, son of Mambrino Patchen 58, etc. [See Stray Moments, Vol. VII.] Bred by Edward Gray, Meadow Lands, Pa. [Vol. XII.]

FALLEN LEAF, (7) b m foaled 1887; by Fallis 4781; dam Mabel Echo; by Echo 462; g d Sister to Ruth Ryan, by Lodi, son of imp. Yorkshire; g g d Eva Bulwer, by Bulwer, etc. [See Stud Book.] Bred by William A. Gamble; passed to George H. Roe, San Francisco, Cal. [Vol. XII.]

FLORENCE BLACK, (7) gr m foaled 1890; by C. P. R. 15851; dam Sis Lee, by Abdalbrino 2646; g d Early Bird, pedigree not traced. Bred by John O'Donnell, Covington, Ky.; passed to John A. Sroufe, Dover, Ky. [Vol. XII.]

FRANK ALLEN 21101, (4) bl h foaled 1870; by Ethan Allen 43; dam Nelly Litchfield, by Hiram Drew, son of Drew Horse 114; g d Young Litchfield, pedigree not traced. Bred by John R. Farnum, Waltham, Mass. Sire of Star Ethan, 2:26½. Record 2:42. [Vol. XII.]

GRACE DORMER, (7) gr m foaled 1892; by Wilkesbarre 5244; dam Jenny, by Chepacket 2290. Bred by W. F. Sifton, Strathroy, Ont., Can. [Vol. XII.]

GUARD, (7) b m foaled 1891; by King Clay 594; dam Hannah D., by Abdalbrino 2646; g d Becky B., by Bourbon Abdallah, son of Abdallah (Hurst & Thornton's); g g d Becky Bird, by Joe Desher. Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

HIGH WAVE, (6) b m foaled 1892; by Oceanus 9443; dam Neetmore, by Nutwood 600; g d Keenemore, by Strathmore 408, etc. [See Nutmore, Vol. VII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

ISLAMITE 20980, (6) b h foaled 1891; by Clay King 2964; dam Katherine (dam of Preston Mohammed (Preston) 2:27¾), by Shelby Chief 923; g d by Mahomet, etc. [See Katherine.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

JOHN DOWD 21204, (6) b h foaled 1892; by Oceanus 9443; dam Bonnie Blue Eyes, by Baron Wilkes 4758, g d Odd Stockings (dam of *Happy Russell*), 2.21½), by Happy Medium, 400, etc. [See Bonnie Blue Eyes, Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

Kate Sparks, (5) ch m foaled 1872; by Black Snake; dam Snip; pedigree not traced. Bred by William M. Sparks (then of Leesburg, Ind.), Greensburg, Kas.; passed to Hobson & Pitman, Bedford, Ind.; dam of *Humming Bird* 2:22. [Vol. XII.]

LADY DILLON, (7) ch m foaled 1892; by Dexter Prince 11363; dam Beauty, by General McClellan, 143; g d Minnie, by Nana Sahib (Butterly's). Bred by M. D. Baker, Stockton, Cal. [Vol. XII.]

LAURELIA, (7) ch m foaled 1892; by Caution 10581; dam Buttercup, by Alwood 972; g d Daisy, by Anvil, son of Ericsson 130. [See Buttercup.] Bred by Thomas H. Brents, Walla Walla, Wash. [Vol. XII.]

LIDA BLUETT, (7) b m foaled 1892; by J. W. Bailey 3457; dam Fanny R., by William M. Rysdyke, Jr., 8541. Bred by P. E. Lacy & Co., Lansing, Mich. [Vol. XII.]

LIZZIE LAWTON, (6) b m foaled 1892; by Oceanus 9443; dam Mickie H., by Wheeling Wilkes 7761; g d Lucy F., by Alcalde 103, etc. [See Mickie H., Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

MAID OF PRINCETON, (7) br m foaled 1890; by Barney Monroe 7739; dam Maud, by Pardo 1420; g d Fanny, by Emperor Eclipse, son of American Emperor 35. Bred by E. F. Perschke, Princeton, Pa.; passed to J. R. Taylor, Beaver, Pa. [Vol. XII.]

MARBLE, (6) b m foaled 1891; by King Clay 594; dam Medio, by Cooper Medium 11731; g d Topsey, by Mambrino King 1279. [See Medio, Vol. IX.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

MARIE ELECTIONEER, (7) b m foaled 1892; by Electioneer 11671 (Campbell's); dam Kate Thorne, by Hero of Thorndale 549; g d Lyda, by Ned Forrest (Sim's), son of Edwin Forrest 49, etc. [See Kate Thorne, Vol. VIII.] Bred by A. W. Toole, St. Joseph, Mo. [Vol. XII.]

MARKSMAN MAID, (2, 6) b m foaled 1881; by Marksman 592; dam Fanny, by Ben Abdallah, son of Abdallah 15. [See Fanny.] Bred by C. W. Belding, Dover Plains, N. Y.; passed to J. L. Richardson, Lime Rock, Conn. Record 2:21¼. [Vol. XII.]

MAUD, (5) gr m foaled 1878; by Quaker General, son of General Knox 140; dam Bess, by Bismarck, Jr., son of Bismarck (Howe's); g d Jenny, by Colonel Kling, son of General Knox 140. Bred by Charles H. Brann; passed to D. C. Green, Stark, Me., then to S. O. Tarbox, Farmington, Me., then to George Eastman; then to F. D. S. Brown, East Wilton, Me. Dam of Maud Mace 2:27¼. [Vol. XII.]

MOLLY FIELD, (6) b m foaled 1892; by Mark Field 10177; dam Daisy, by Mambrino Trump 1357; g d Bay Dolly, by Advance 9981, etc. [See Daisy, Vol. X.] Bred by William W. Glover, Aurora, Ill. [Vol. XII.]

NED MILES 21038, (6) b h foaled 1889; by Montana Wilkes 14208; dam Alberta (dam of Florida 2:21½), by Dalgamo 13047; g d Tweedledum, by Lexington Golddust 4205, etc. [See Alberta.] Bred by Noah Armstrong, Twin Bridges, Mont.; passed to

James P. McCann, Lexington, Ky.; then to Carl K. White, New Hope, Ky. [Vol. XII.]

MS, (6) b m foaled 1892; by Nelson 4209; dam Mina, by Monon 4071; g d Elmina, by Kentucky Prince 2470, etc. [See Mina, Vol. IX.] Bred by F. S. Gorton, Chicago, Ill. [Vol. XII.]

IVENTUS, 20919 (6) br h foaled 1891; by Adirondack 719; dam Nettie, by Nutwood 600; g d Kate Henderson, by Bellfounder 62. [See Nettie, Vol. X.] Bred by G. V. James, Hillsboro, Ore.; passed to Matt Mosgrove, Pendleton, Ore. [Vol. XII.]

EITA, (6) b m foaled 1891; by Edgewood 8069; dam Hilto, by Harry Clay 45; g d Hilda, by Thorndale 305, etc. [See Hilto, Vol. VI.] Bred by Edgewood Stock Farm, Terre Haute, Ind.; passed to J. T. Fargason, Memphis, Tenn. [Vol. XII.]

RLIE, (6) b m foaled 1892; by Oceanus 9443; dam Fan B., by Onward 1411; g d Beulah, by Blackwood 74, etc. [See Fan B., Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

ETE TURNEY, 21203 (6) b h foaled 1892; by Oceanus 9443, dam Hesione, by Princeps 536; g d Ozone (dam of Geneva, 2:19¼), by Hambletonian 10, etc. [See Hesione, Vol. VI.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

LACID, (6) b m foaled 1891; by Clay King 2964; dam Content, by King Philip 8577; g d Darlbay's Daughter, by Darlbay 441, etc. [See Content, Vol. VIII.] Bred by P. P. Johnston, Lexidgton, Ky. [Vol. XII.]

LUMLENA, (6) b m foaled 1886; by Harry Plummer 2976; dam Angeline, by Chester Chief 2172; g d Lady Pine, by Mapes Horse 2063, etc. [See Angeline, Vol. VI.] Bred by C. A. Seeley, Chester, N. Y.; passed to Powell Bros., Shadeland, Pa.; then to E. D. Gould, Fullerton, Neb. [Vols. VII and XII.]

PRESTON MOHAMMED (Preston) 20979, (1 6) b h foaled 1888; by Wilkes Boy 3803; dam Katherine, by Shelby Chief 923; g d by Mahomet, etc. [See Katherine.] Bred by P. P. Johnston; passed to John E. Mad den, Lexington, Ky. Record 2:27¾ under the name of Preston. [Vol. XII.]

PRINCEDALE 20869, (6) ch h foaled 1888; by Thorndale 305; dam Kentucky Heiress, by Kentucky Prince 2470; g d Heiress (dam of Toxie, 2:28½; Nightingale, 2:28¾, a d Litchfield, 2:29¾), by Abdallah 15, etc. [See Kentucky Heiress, Vol. VIII Bred by J. L. Richardson, Lime Rock, Conn. [Vol. XII.]

RESPONSE, (7) b m foaled 1892; by Wilkesbarre 5244; dam Christena Wilkes, by Western Wilkes 4566; g d Mab, by Verus. Bred by Edward Bateman, Christena, Ont., Can. [Vol. XII.]

SAFFRONA, (7) ch m foaled 1891; by Antelope 16323; dam Buttercup, by Alwood 972; g d Daisy, by Anvil, son of Ericsson 130. [See Buttercup.] Bred by Thomas H. Brents, Walla Walla, Wash. [Vol. XII.]

SAND 20590, (6) b h foaled 1891; by Clay King 2964; dam Katie C., by Mambrino Howard 3656; g d Meteor 2:31, by Clark Chief 89, etc. [See Katie C., Vol. VII.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

SAN SALVATOR 20977, (6) bl h foaled 1891; by Counsellor 1842; dam Susie Mac, by Lyle Wilkes 4658; g d Maggie Robinson, by Garrard Chief 2253, etc. [See Susie Mac, Vol. VII.] Bred by W. W. Carney, Great Bend, Kas.; passed to Doc Cormody, Dubuque, Iowa. [Vol. XII.]

SEA PEARL, (6) b m foaled 1892; by Oceanus 9443; dam Katie M., by Wilton 5982; g d by Ashland Chief 751, etc. [See Katie M., Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

SIGNET, (5) b m foaled 1878; by Satellite 2500; dam Pacing Nelly, pedigree not traced. Bred by Powell Bros., Shadeland, Pa.; passed to Thomas F. Miller, Fullerton, Neb. Dam of Fred K., pacing record, 2:18½. [Vols. XI and XII.]

SIGNORINA, (6) bl m foaled 1891; by Lexington 8579; dam Rapid Ann, by Shelby Chief 923; g d Betty Martin, by Mambrino Time 1686, etc. [See Rapid Ann.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

STAY-SAIL, (6) br m foaled 1891; by Simmons 2744; dam Eulalee, by Shelby Chief 923; g d Betty Martin, by Mambrino Time 1686, etc. [See Eulalee, Vol. VII.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

THAD FLETCHER 20970, (6) bl h foaled 1891; by Gilroy 1186; dam Lady Loomis (dam of Roy B., 2:24¾), by Claybrino 90; g d Kitty Price, by Black Prince. [See Lady Loomis.] Bred by M. F. Kelly, Winooski, Vt. [Vol. XII.]

THULA, (7) b m foaled 1892; by Manipulator 9341; dam Polly, by Swigert 650. Bred by H. F. Bues, Milwaukee, Wis. [Vol. XII.]

Digitized by Google

TIDE MARK, (6) b m foaled 1892; by Oceanus 9443; dam Blue Mark, by Victor Bismarck 326; g d Hamletta, by Hamlet 160, etc. [See Blue Mark, Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

TOPSEY WILKES, (7) b m foaled 1892; by Foundation 5111; dam Mina, by Abdallah Star 2771; g d Lady Bashaw, pedigree not traced. Bred by J. J. Smart, Dakota City, Iowa; passed to H. M. Griffin, Fort Dodge, Iowa. [Vol. XII.]

ULALUME, (6) b m foaled 1891; by Lexington 8579; dam Annabel Lee, by Aberdeen 27; g d Betty Martin, by Mambrino Time 1686, etc. [See Annabel Lee, Vol. VII.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

UNCLE JIM 21202, (6) b h foaled 1892; by Oceanus 9443; dam Glen Mary, by Belmont 64; g d Lucy, by Swigert 650, etc. [See Glen Mary, Vol. VIII.] Bred by E. A. Collins, Milan, Tenn. [Vol. XII.]

UTOXETER 20858, (6) b h foaled 1891; by Alert 737; dam Miss Hope, by Armagh 4683; g d Emma Wilkes, by Lyle Wilkes 4658, etc. [See Miss Hope, Vol. VII.] Bred by W. W. Foster, Johnstown, Ohio. [Vol. XII.]

VAN DEL 20959, (6) b h foaled 1892; by Delavan 17404; dam Erminie, by Administrator 357; g d Lady Lightfoot 2:33¼, by Allegheny Chief 23. [See Erminie, Vol. XI.] Bred by A. R. Van Tassel, Du Bois, Pa. [Vol. XII.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

BUTTERCUP, ch m foaled 1885; by Alwood 972; dam Daisy, by Anvil, son of Ericsson 130. Bred by Thomas H. Brents, Walla Walla, Wash. [Vol. XII.]

NYLGAU, ch m foaled 1892; by Antelope 16323; dam Daisy, by Anvil, son of Ericsson 130. Bred by Thomas H. Brents, Walla Walla, Wash. [Vol. XII.]

SWIPSEY, b m foaled 1892; by Oceanus 9443; dam Grey, pedigree not traced. Bred by R. L. Jordan, Milan, Tenn.; passed to W. T. McCracken, Waverly, Tenn.

RECORD OF OFFICIAL TRANSFERS.

NOTE.—When registered animals change owners the transfer may be recorded here and will be carried into the next volume of the Register, thus maintaining the identity of the animal with the new ownership. The fee is twenty-five cents.

ABDALLAH PILOT 2084, (6) gr h foaled 1877; by Administrator 357; dam Lucille, by Abdallah 15, etc. [See Vol. V.] Passed to Bolivar K. Walker, Denver, Colo., April 29, 1891.

ALLEN MAC 19631, (6) b h foaled 1891; by Allendorf 7462; dam Elsie Mac, by Robert McGregor 647. [See Vol. XI.] Passed to William P. Sullivan, Boston, Mass.

ALVARETTA, (5) b m foaled 1876; by George Lancaster, son of Royal George; dam Melinche (dam of Fred Crocker, 2:25¼) by Saint Clair 16675. [See Vol. IX.] Passed to Frank H. Burke, Menlo Park, Cal. Dam of Aleck B., 2:25¾ and Alma 2:28½.

ANGUS, (7) b m foaled 1887; by Polonius 4090; dam Rosebud, by Volunteer 55, etc. [See Vol. X.] Passed to U. C. Abendroth, Port Jervis, N. Y.

ANKALI M., (7) b m foaled 1889; by Vic Monroe 8545; dam Maud, by Valorous, 3075. [See Vol. IX.] Passed to Nathan Harvey & Son, New Castle, Ind., January 25, 1890.

ANNA LISLE, (6) b m foaled 1890; by Rohmer 7270; dam Virginia Lisle, by Alecto 2548, etc. [See Vol. X.] Passed to James Bowers, Monmouth, Ill., October 27, 1892.

ANTEA WILKES, (6) b m foaled 1888; by Guy Wilkes 2867; dam Amy Fay, by Anteeo 7868, etc. [See Vols. VIII and IX.] Passed to Schmulbach & Park, Wheeling, W. Va., January, 1892.

ARTERO 17126, (6) b h foaled 1891; by Erie Wilkes 3610; dam Jenny Prewitt, by Governor Sprague 444, etc. [See Vol. XI.] Passed to J. R. Oakden, Corning, N. Y., May 25, 1892.

ASBESTOS 11695, (6) b h foaled 1888; by Hambrino 820; dam Starling, by George Wilkes 519, etc. [See Vol. IX.] Passed to Bergh & Johnson, Harmony, Minn., October 29, 1892.

ASHLAND KING 4951, (6) b h foaled 1886; by Dictator 113; dam Albrina, by Almont Chief 361; g d Mary Bostwick pacer 2:31 (dam of William Wallace 2:28½ and Mohawk Chief 2:30); pedigree not traced. [See Vol. VI.] Passed to Shannon & Co., Lexington, Ky.

Digitized by Google

ELIA, (6) dn m foaled 1891; by Muscovite 5221; dam Silver Gift, by Grand Sentinel 865, etc. [See Vol. X.] Passed to W. E. Hagans, Elmhurst, Ill.

LINO 13308, (6) b h foaled 1890; by Antevolo 7648; dam Red Flame, by Red Wilkes 1749, etc. [See Vol. IX.] Passed to George S. Davis, Claireview, Mich.; then to John Armstrong, De Smet, S. D.

DOLINE, (1, 2) b m foaled 1884; by Ambassador 1496; dam Ida Miller, by Blue Bull 75, etc. [See Vol. VIII.] Passed to J. Lee Newton, Peoria, Ill.; then to Allen L. Cranston, Willimantic, Conn. Record 2:28½.

PROBLEMS IN BREEDING.

BY A. H.

Heredity.

IV.—TEST.

The Above Contrasted with the Opposite View of a Present-Day Teacher.—Says Professor Brewer: "If the increased size due to better nutriment during the growth of the animal is not transmitted in any degree whatever, then it is a double mistake for breeders to practice their present methods with animals intended for breeding. Abundant nutrition when the animal is young should then be confined to those intended for slaughter and for general use. The underfed and stunted should then be the best breeding animals, because if unfavorable environment promotes congenital variation and such variation takes place in every and all directions, then the true method to practice in the improvement of breeds as to size, would be to underfeed the young and growing animals intended for breeding purposes, and thus induce congenital variation in their offspring, and then rely upon the selection of the favorable variations induced in the successive generations of starvelings."

We are afraid Weismannian supporters will be unable to follow Professor Brewer in this, simply because they do not admit at all that environment, underfeeding or overfeeding has any influence whatsoever in causing congenital variations. We are afraid there is a misunderstanding somewhere, for Mr. Brewer saddles onto the new theorists conditions for effecting their purpose, which are not theirs but purely their opponents. For the only source of congenital variations they admit of is the union of two different ancestral germ-plasms. The only chance that there is of outside conditions influencing this is the "chance" circumstances that may bring two differently endowed individuals of the same kind together. Starvation may be a chance circumstance that may decrease the possibility of favoring these combinations, being of the same order in this respect as everything that tends to weaken or undermine the individual (body) itself that prevents its normal sexual activity. The direct effect of increased or decreased nutrition on the individual we can also conceive as having a similarly direct immediate influence on the germ-plasm, making the molecules of the same larger or smaller respectively. Also the same influence, if continued, through several generations, we can see that as in the first instance the germ molecules were larger or smaller according to the nutrition, when the two parents' contributions combined, the larger or lesser characteristics would remain and would be represented in the next generation likewise. But this does not effect the quality, though it may effect the bulk of the molecular constitution, no more than heat effects the composition of the mercury. But this is only a partial illustration. It —nutrition—causes no permanent difference. Besides the germ-plasm *itself* possesses the power to utilize or resist increased or decreased nutrition. While of course as long as mortality exists, nutrition is necessary, some germ-plasms—thence individuals—can thrive on less

Digitized by Google

than others, while others need more, yet no *over supply of food* can be absorbed against the disposition of the germ-plasm etc. There is a limit to expansion as there is to contraction—which latter being starvation may be death. Hence the power resides *not* with the food, but with the germ-plasm—not with the supply, but with the ability to assimilate.

We shall elsewhere further indicate that Professor Brewer need not give himself over to the "gospel of despair" which he also seems to think would be the result of accepting the new theory. We shall show that the very methods that have been in vogue must still be used, though more intelligently, but not as a "cause," but as a test of ability to stand the strains involved in the old methods of that "causation."

A Sample Test Case—"K N" Feeding.—We are indebted to the *Saturday Review* for the following paragraph:

In the year 1871 an important discovery was made with regard to the coloring of canaries. In that year certain birds began to be exhibited which eclipsed all competitors in richness and depth of coloring. For several years the secret was kept, its possessors meanwhile winning prizes wholesale. As the birds were of two colors, the wing and tail-feathers being greenish yellow and the rest orange, the liveliest curiosity was excited as to the cause of so mysterious effect. Foul play was suspected, and the birds were submitted to an analysis, only to be reported guiltless of dye. At last the secret was discovered independently by an outsider, who, scorning the gains to be got by illiberal reticence, presented it to the world, and announced that the superb coloring was the result of feeding the birds on cayenne pepper in the moulting season. This announcement, which would doubtless be interesting to Mr. Bates and Mr. A. R. Wallace, also created a dispute as to whether any cruelty was involved in making a bird eat several teaspoonfuls a day of so sharp a condiment. Some asserted that it spoiled their digestions and ruined their constitutions; others maintained that they liked the "K N regimen" (as they jocularly called it), and that the capsicum frutescens was the natural food of many wild birds; and the dispute is by no means settled yet.

The best possible test of the effect of the influences, of acquired changes or characters in the soma (body), on the germ-plasm, we submit ought to be derived from that class of facts, one of which we have given a sample of above, that have reference to the changes evidently produced by food, etc., on the appearance of the animal. By feeding canaries, as per example, on cayenne pepper, such feed at once materially effects the color of the plumage. Here there is no doubt of the effect on the individual of feeding. But this effect has never been transmitted to the offspring of animals so fed and affected.

Food, etc., do Not Originate Force, Strength, or Size. Burns says:

"See the plowman haggis fed,
The trembling earth resounds his tread;
Clap in his waly nieve a blade—
He'll gar it whistle;
And legs, and airms and heads he'll sned
Like taps o' thistle."

Burns meant that a man able to assimilate the Scottish haggis—a mixture of minced flesh, oatmeal and other nitrogenous materials—or powerful food, will have a powerful body, and make his muscle like fine tempered steel, and if a man is fed on pie and pudding he will become the reverse. Though, as Johnson pointed out, oats was the feed of men in Scotland and of horses in England, which definition was justified by the comment it received from a more discriminative observer who declared: "And where are there better men or better horses?" yet if it had not been for the goodness, naturally, of the race of men and of horses, the oats would have been of no benefit, and we would not have had the famous definition or retort.

Quantity or concentration of food and constant training have never produced a Sullivan or a Corbett. They never will. But an individual naturally endowed may, by the applied test of fitness for assimilating muscle-producing food, and of enduring training, become celebrated in agonistic feats—in direct proportion to their development in the individual—out of the predispositions accumulated in the germ-plasm.

On the other hand, slop-food—which is unnatural—would as certainly disagree with one individual as highly nitrogenous would with another. In either case, if enforced and continued where it was assimilable, it would interfere with the development intended by nature, and in this way, alone, would create an obstruction to the proper exercise of function and even bar the reproductive process it-

Digitized by Google

self. If the test was not too severe, if it did not immediately destroy the purposive acts of individuals, and if survival were possible, though on a debased level, the potentiality of the germ-plasms might, in their powers of evolving new characteristic tendencies, discover plasm-combinations that, in individual results, would be better able to take advantage of changed dietary, and thus eventually a race that might live on slop instead of haggis might arise. In fact, in the wider range of nature this is surely instanced in the great divisions of the animal kingdom.

A Lamarkian Straw.—We have heard of the experimentalist, who, anxious to discover *how little* a horse could or would live on, had gradually, successfully, trained his subject down to *one straw* a day, at which result he was perfectly delighted. He had solved a problem, achieved success in this path of training, and was doubtless "shaking hands with himself" in anticipation of the even further withdrawal of that one unnecessary straw, and on the perpetuation of an improved breed of non-eating horses, when *the horse actually died*, kicking his (Lamarkian) ideas all to pieces; ungrateful mule!

But all animals do not eat alike. There are small eaters and large eaters. Sometimes large eaters are as useless as small eaters. Sometimes small eaters are as gritty as large. *It all depends* not on the *amount of feed*, but on the *constitution* of the animal. Hence it is reasonably possible to "evolute" or develop a breed of horses of a useful character that require a "minimum" allowance of food. But that minimum would be to it its maximum, necessary to its healthy development and use.

In the above we see that the Lamarkian view is not governed by natural limits as the opposing view is. In the former, extremes of conditions effect the individual so as to remove it, or debar it from continuing its specific purpose of perpetuating its like. In the former the specific force seeks to perpetuate itself in the most favorable natural conditions for achieving the same great purpose. Artifice, therefore, continually interferes, nature continually aids that purpose.

Leading Methods in Relation to Fattening Propensities Considered.—"Different breeds vary," said Dr. Anderson, from each other also, to an astounding degree, in respect to their propensity to increase in corpulency by abundant feeding. No art can ever bring the greyhound to be as full of flesh as a breed of lap dogs (I believe they are called shock dogs), which have a propensity to fatten more than any others, and it is not a little remarkable that some of the leanest kind of dogs eat the most food of any in proportion to their size. It has often been remarked that a greyhound is the most voracious of all dogs, and that a mastiff, in proportion to its size, eats very little, though it may very easily be fattened. The blood horse and the Alderney cow can never be made so fat as many other varieties of their species." "Such remarkable diversities are occasioned merely by breed," *i. e.* variations of the germ-plasm fixed by selection. Again "we are led to conclude that there are varieties of the same species which are radically different in point of size, and which can not be made to approach each other by any mode of management whatever *where the blood is* [or *remains*] *unmixed*," "No treatment could ever bring a breed, naturally small, to equal the size of one that was originally large, if it can be reared where it can have food and warmth in abundance."

Breeders of breeds that have reached fame as beef cattle did not originally start on cattle like unto Pharoah's lean kine and by feeding such eventually create well-favored descendants.

High feeding is entirely a modern innovation for which the breeds have been gradually prepared, not by feeding, but by that test as indicating selection.

What the breeders did was to hunt for individuals that possessed natural, well-favored feeding propensities. And, as Dr. Anderson shows how it was done, "intercopulate" the individuals so selected. Breeders threw aside in each succeeding the generation misfits or substandard and again *restricted* intercopulation to the elect of the select. Of course, though feeding was not carried to a high pitch in the early days, what feeding was in vogue was simply and purely a *test for*

Digitized by Google

selection, i. e. on feeding a herd those that lay on most flesh were marked out as best fitted to breed from, as containing in their germ-plasms that molecular constitution which had produced them as the best.

Thus, while feeding was constantly testing each generation, it was not increased feeding that was acquiring for the breed increased "propensity to corpulency," but the increased concentration of the ancestral corpulency tendencies (germ-plasms) of the selected results of the test by "intercopulating," *solely* with themselves.

So that as the world grew older, the breed was accumulating congenitally all its ancestral molecular "propensities to corpulency." So satisfactorily was this accomplished that the corpulent tendencies were accumulated in such excess that the breeders who had been responsible for this "entailed on their successors the necessity of creating a breed that could make lean," just as indicated by Dr. Anderson. That this has been also successfully accomplished, *and all as a matter of breed*, any one acquainted with the history of bovines and Smithfield (London) and Chicago Fat Stock Shows must abundantly admit.

Change of Environment Favors, not Induces, Other Previously Suppressed Variations.—Professor Brewer also says: "*Medium* sized Shetland ponies and *medium* sized Percheron horses will each increase in size in a region of especially abundant food and diminish in a region of scanty food." As we assert that it was the influence of natural selection that adapted the Shetland, etc., to its environment, are we to refuse the influence of natural selection to operate on the breed if removed to other more favorable environments?

The conditions existing in Shetland are such that only those animals naturally constituted can stand the test of survival. This is, as it has to be over and over again reiterated and made clear to those who have not yet cleared their ears to hear properly, natural selection. Now it is surely evident to the understanding that can comprehend the distinction—"fine" if it is—that an environment, "more favorable" as it is called, would permit of the survival of those that would have failed—"plucked" in their "exam." by inexorable dame nature—to come up to the required standard necessary in Shetland. That means that in a more temperate clime, or less severe "exam.," the former "plucked" ones would now pass muster and "graduate" or survive. Here new elements would be retained, there would arise practically a new variety. *And* "intercopulation" being unpreventable of course, the result would be that there would occur in succeeding generations a tendency toward increasing numerically the characteristics of the now more favored. But if an equivalent process of selection were continued, under the conditions of the new environment, that would then take the place of the original test—for selecting out such as would only survive there—the breed would of course remain absolutely the same. Mr. Brydon shows how successfully this can be done by an *artificial-selection* test alone.

It appears to us to be a thorough misconception to attribute to the environment results that are due to the selection—which counts in in one case what is counted out in the other. This explanation makes all the more clear the possession of all force by the germ-plasms and not by the outside influence. It would be utterly impossible to convert the germ intended for a Shetland into a Percheron by any outside influence whatever.

Origin of Size in Large Breeds.—Professor Brewer further says: "So far as I know, all the breeds of especially large horses, cattle and sheep have originated in districts of abundant food, usually in fertile valleys or on plains. . . . . and the smaller breeds have originated in districts of scantier forage." The latter statement is answered by Dr. Anderson, elsewhere quoted; what we want to deal with here is the first statement. We shall take as a "test" case the Clydesdale breed of horses. Some months ago, in this magazine, the authority of Mr. Thomas Dykes was quoted to the effect that it was the old breed of Scottish horse known as the galloway that was the lineal ancestor of the Clydesdale horse

Digitized by Google

of the present day—the pride of bonnie Scotland and more beyond. The increase of size in the present horse over the extinct is at least *two inches*. Here, apparently, is a perfect proof of what Mr. Brewer believes. *But* let us enquire into the matter of this increase of size. Mr. Thomas Dykes, in the new edition being issued, under the editorship of Mr. James Sinclair, of Sidney's "Book of the Horse," says; "There was no desire to increase the size of the Scottish horses till more peaceful times set in, after the union between England and Scotland. The native breed being then short-legged and active but small, there existed a desire for more power in the collar for plowing purposes, and so, as mentioned in the introductory history to the retrospective or initial volume of the Clydesdale Stud-Book, one John Paterson, of Lochlyoch, in the Upper Ward of Lanarkshire, in the year 1720, went from Scotland into England, and brought from thence a Flemish stallion, which is said to have so greatly improved the breed in the Upper Ward as to have made them noted all over Scotland." It was these Upper Ward horses to which the improved breed traces. Here the beautiful theory of effect of "fertile valley" is all knocked on the head. The same method of raising the size, etc., of breeds, equine, bovine, ovine, or porcine, might be traced through all.

Mr. Thomas Dykes, in the place referred to, says that the importation mentioned was the only one that can be satisfactorily traced, though others are stated to have been made. Mr. Alexander Galbraith traces the introduction of Flemish blood as far back as the time of the Norman conquest, when William the Conqueror was accompanied by the Earl of Flanders and a strong force mounted on the very finest chargers in the world. "These were Flemish horses, said to be descended from a combination of the strong black horse of Flanders, the Arabian bay and the original Asiatic white horse..... The abundance of lime in the soil of Flanders contributed liberally to the growth of his osseous framework, and in size and quality of bone he never was and probably never will be excelled." Mr. Galbraith believes that in the year 1352 Flemish blood was permitted to enter Scotland from England, and also that in the seventeenth century similar importations took place. He believes, therefore, that the Clydesdale is a composite breed, consisting of the blood of the original native Scotch mares and of that of the Flemish, itself a composition of Arabian and Asiatic on the native foundation.

Youatt says: "All our [*i. e.*, British] draft horses, and some even of the lighter kind, have been lately much crossed by the Flanders breed, and with evident improvement."

We have also seen above that the Flemish horse is a composite horse. Admitting that it was indigenously a large-sized breed and that the conditions were favorable to a large breed, we have simply to follow the tendencies of the germ-plasm which, being attended to by the conditions assumed of favorable soil, etc., developed the tendencies toward increased size; and these tendencies materializing, developing thus in the breed, by being attracted, like to like, to the exclusion of all mixture with those of opposite tendencies, thus originated from the germ-plasm, not from external influences which would require to elevate the size of all alike, which is what never happens.

These size-favored kept possession of the favored plains and valleys. Those which were congenitally diminutive did not require to die out; they continually swarmed off, made an exodus into the less appropriated high lands where natural selection favored those individuals able to survive, advantageously to the perpetuation of their line or race. Thus a process of natural selection was the force that developed indigenous varieties. This was aided by the segregation of the large, the stronger in the richer localities, they being the better able to retain the more favored location. This necessitated the withdrawal of the smaller, less strong, individuals to "find their level" on the higher or more secluded regions more fit for them and less fit for the larger ones. Hence natural permanent varieties became developed by a continued process of "sizing up" and weeding out. There

Digitized by Google

is always an effort at continual attraction of *the like to the like* and a finding an environment in which they can perpetuate their like. Hence though natural selection does not, in actuality, create the fitness (as old notions regard fitting) for the environment, because it can not create characteristics fit for a condition which has not yet existed in the experience of the evolved results, yet wherever it has evolved characteristics that can take advantage of a "change of venue" it very quickly does so, swarming off from the old set, and hence finding an environment fitted to the new evolution and its temporary and permanent perpetuation. Hence keeping up its fitness for its environment involves only the selection of the standards, lopping off the substandards. Environment is therefore only a test. No less true is it that if an environment or conditions are not handy for such favoring of evolved characters, the individuals exhibiting them at once drop to the rear and have no chance for either temporary or permanent advantage.

Of such many evolutions thus developed some may be "fit"—*if not fitted*—and some unfit for living or thriving in new environments. When *such* accidental (usually) occurrence happens—as the force of evolution is never dead—the evolution of variations that were previously useless, had no chance to assert themselves—if they were of no benefit—now, under different yoke-master, condition or test development, where formerly they would have been hustled to the wall. Among these variations thus developed there may be some of a character that naturally endows them with advantages that indicate their greater "fitness" for the new environment. These at once step to the front, are favored by natural selection—because they have some new characteristics that. render them more immune to the life destroying agencies they now encounter, or able to take greater advantage of the new opportunities offered them. Hence these tend to be preserved at the expense of the original type. In course of time therefore there is a complete change in the descendant species to the introduced.

In the above instance we have one which is often brought forward to prove the effect of external conditions, etc.—environment—on animals. We see, at least we are forced to the conclusion. that the facts can be interpreted differently, and much more reasonably and consistently, by the force of natural selection.

A Counterfeit Presentment. — But there is another picture of the Flanders which we quote below, but are unable to here refer the reader to the authority, having misplaced it:

"In Flanders where the air is humid. and pastures moist and rank, horses grow large, but they have flat feet, inferior sinews, lymphatic temperaments and soft hearts. Flemish horses have been imported largely into England, because they were cheap, big and showy, but they have always been noted for their lack of endurance. The Flemish coach horses were so deficient in toughness and grit that the job masters found it cheaper to employ English-bred horses at double the price." History has made us acquainted with the fact that, proverbially "Like a Flanders mare" was a term of scathing scornscant courtesy.

Apparently there must have been more than one kind of Flemish horses. The latter is certainly not the kind the best breeders of horse flesh in the world would select for heavy uses. But that is not exactly the point immediately involved. We can discuss the alleged effects of, soil, etc., on a supposititious case as well as on a real case. Instead of the soil and atmosphere being the cause of the alleged hardness or softness, etc., we believe that these qualities were developed in localities of dry air and soil, and damp air and soil respectively, because or on account of the inutility or non-effectiveness of qualities of the opposite nature required by either condition; hence the individuals exhibiting the germ-plasm tendency to softness or hardness, etc., being better adapted to damp or dry environments, were naturally favorable for such conditions, so remained in possession; their kind, at the expense of the other, which were of no use there, being perpetuated. The picture of the Flemish horse we are discussing evidently

Digitized by Google

refers to a recent date and to non-breeding animals. Possibly the breed has degenerated from its palmier state, and also the breeders lost their cunning. Anyhow it would not be *such* poor protoplasmic jelly that would ever have commended itself to British breeders.

The Foot and the Footing.—Climate and soil, etc., have always been considered to have had a direct influence on the feet of horses, which has been just controverted in connection with general softness in immediately preceding remarks. But we may give the point a little further attention.

Across Central Arabia, we are told, extends a vast territory called the Nedyd, composed of sandy deserts and rich pastures. The whole region is a plateau, and the atmosphere is dry and bracing. It is under such conditions that the Arab horse has thrived. "In such country the hoofs require no shoes." In India and Australia the horse "becomes much improved in respect to soundness of feet and lungs, doubtlessly," it is stated, "the effect of drier climate."

Recently it was quoted in this magazine, for instance, that horses bred in the mountains of Wales, England and Scotland had good feet, while those bred in the fens of Lincolnshire, etc., had commonly flat and soft feet "due to the moist soil, which relaxed the texture of the hoof."

The famous veterinarian, Dr. Fleming, says: "The size of the hoof depends not only on the treatment they receive at the hands of the shoers, but also upon the climate and nature of the soil. It is not at all uncommon to find what are called 'odd-sized' feet belonging to the same horse, and they may be perfectly free from disease. One foot smaller than the other is often congenital, and this neither predisposes to disease, nor is it an indication of any morbid condition, unless the animal is lame, or the inequality may be due to the shoer or to a shoe having been lost. Large hoofs, with prominent frogs and rather flat soles are generally found in moist countries. Narrow small feet, with hard, dry horn and rather diminutive frogs and concave soles, are usually observed in dry climates with rocky or sandy soils."

We are not addressing our remarks to Dr. Fleming. But has it ever occurred to the others that as soft feet would be of no use in Arabia, that whenever an animal showed the slightest tendency to develop a poor foot, he would immediately be, naturally, selected out of the breeding studs? Hence the hard foot was favored, the soft disappeared from the perpetuating lines of the race. The same process was in force in regard to the soft, marshy districts—hard feet were of no use therein, hence the tendencies to soft feet were favored. The condition preceded the development, and the development of kind of characters were those most suitable to that condition, and there was thus a continuous check on the development of quality of hoof not suitable. This test selected soft or hard hoof tendencies, according to the respective development that favored the environment.

Effects of Intercopulation.—Mr. H. C. Merwin, in a recent *Atlantic* article, writes: "A thoroughbred foal, born in India of English parents (imported) bears unmistakable evidence of his birthplace, and in the second and third generations the colonized thoroughbred loses all the resemblance to the native English stock." From remarks by Professor Wallace in his "India" where he says: "The results in breeding do not indicate that the class of stallions selected to be taken to India to cross with country-bred mares have been the best suited to the purpose," he would indicate that the English parents belonged to the male sex only, besides being of inferior quality; the mares being of Arab extraction. It is improbable that thoroughbred mares would be taken out of England for the purpose of breeding in India—generally unsuitable as it is for horse breeding. The fact of the success of the thoroughbred in America and Australia further tends to beget a belief that the results referred to by Mr. Merwin did not involve both thoroughbred sires and dams, to the *third* generation; but that the use of Indian mares intervened. Thoroughbred breeding can apparently be made successful where good horse men and good horse country exist.

Digitized by Google

In the above we have an illustration,

among others herein incidentally given, of what Dr. Anderson called intercopulation, which in latter days has been, in more effective language, advanced so in importance. The best equine case of this influence is the thoroughbred. As this influence is, under various phases, continually coming under notice, it is well to emphasize it. The following, therefore, will serve our purpose in this respect. We quote the memorabilia of the *L. S. Journal:* "The late Mr. R. O. Pringle in 1874 visited the Orkneys. He reported that already the old 'garron' or Orkney cob—the native horse—was almost crossed out of existence. The Clydesdale stallions which had been introduced had enlarged the size, but had not made the horses more docile or more enduring. The Earl of Zetland had introduced the thoroughbred stallion Hawk, and the produce was so good from the genuine garron mares that not one of the stock was left in the island, the dealers having picked up the whole of them, colts and fillies. To succeed Hawk, another thoroughbred stallion was sent. But the garron mares were now wanting, and the half-breds—from Clydesdale sires—were not satisfactory substitutes. The results of the second introduction of racing blood were less successful than were those of the first. In Ronsay were crosses between the Shetland pony and the Orkney garron—strong and useful animals. Have these ceased to exist? A correspondent tells us that 'Sheltie' or 'Shelt' in provincial Scotch, means for the farmer nag-horse. We do not think this name is to be traced to the word Shetland (as is suggested) but to Sheiling, a house or cottage. And the Shelt was the horse kept for the use of the house as distinguished from the work horses kept for the work upon the farm. Both garron and galloway are names for horses which will repay inquiry."

Were There Two Kinds of Buffalo?—The existence of two kinds of buffaloes is firmly believed by many hunters—they name them respectively the "prairie buffalo" and the "wood" or "mountain buffalo." Colonel Dodge* says of the latter: "His body is lighter whilst his legs are shorter, but much thicker and stronger than the plains animal, thus enabling him to perform feats of climbing and tumbling almost incredible in such a huge and unwieldy beast."

Major Bedson, of Winnipeg, who formerly owned the only herd in the Northwest, wrote us a few days ago: "I am satisfied that it is a mistake in attempting to distinguish between the prairie buffalo and the wood buffalo—they are one and the same," but evidently the herd *driven to the woods* for protection *not* adopting it as a result of modifications favored by natural selection fitting them the better for such found change of environment—present some differences in form, etc., that are important to consider.

Mr. W. T. Honnaday thus writes on this point: "There is some reason for the belief that certain changes of form may have occurred in the buffaloes that have taken up a permanent residence in rugged and precipitous mountain regions. Indeed, it is hardly possible to understand how such a radical change in the habitat of an animal could fail, through successive generations, to effect certain changes in the animal itself. It seems to me that the changes which would take place in a band of plains buffaloes transferred to a permanent mountain habitat can be forecast with a marked degree of certainty..... In the course of many centuries the change in his form might become well defined, constant and conspicuous. But at present *there is not the slightest ground for considering that the mountain buffalo or wood buffalo is entitled to rank even as a variety of* Bison americanus." The band of bison in the Yellowstone Park must be of necessity of the wood or mountain variety, from these we may yet eventually more fully follow the course of these changes.

But it would not require the fixing of a new variety to determine the status of the "new" characters thus developed.

The changes that seem to have occurred adapted the animals possessing them to the novel environment. There is in this case permutable selection that would accomplish the change.

In the first place no buffaloes would be driven to the woods unless they were *able* to accomplish "feats of climbing

*Plains of the Great West, p. 144.

Digitized by Google

and tumbling" incredible. Hence we see the advantage of congenital characters of that tendency. It is only a few here and there in the human family, for instance, that are born "adapted" for athletes, tumblers or acrobats. Opportunity in places where such feats are admired soon tests their presence, and training develops them. But no amount of training, etc., would ever develop an acrobat unless he was naturally possessed of the peculiar qualities necessary for success in that line.

And no buffaloes not capable of the rough and tumble of mountain and wood life would be found where they were not naturally fit. Hence there would be a drawing out from the harassed plains buffaloes of those so peculiarly adapted; and if any other straggler followed, he would be the one most liable to lag behind and be picked off by the insatiate long-range rifle of the alleged "sportsman."

Eimer's argument as to parallel species in the new and old worlds, and the peculiarities exhibited in Australia, in which even a parallelism is shown, appear to us not to favor the Lamarkian view so much as the new Darwinian.

Old-world forms that appear in the new world, ought, according to Eimer's argument, to acquire peculiarly new characters—even in selective domestication, but they do not. What is *breed* remains *breed;* what is due to selection and inherent variation—"sport"ing—can not be credited to the narrower "influence" exerted by the soma.

Any new characters that appear in domestication in their indigenous or exotic character, are either due to the effect of all-preservation, or the natural evolution of variations. The latter needs no exposition. Where selection is not rigidly carried out both influences may be at work together.

But a further word as to what we term above *all-preservation.* Any one that has ever been engaged in breeding or "ameliorating" our domestic breeds—for which the French have a very good phrase, Zoötechnie—will fully appreciate what we allude to. In breeding, an opportunity is never lost of securing, early and late, from the willing or unwilling, fit or unfit, dam a colt, calf, lamb, barrow, litter or brood. Further, the preservation of *all* these is aided by all the means in the power of science and art that can be brought into play for that "human" purpose. What is the result? The weak is preserved at the expense of the strong; off form and sub-standard are favored. Hence we have, as compared with nature's process, the survival not only of the unfit—which would otherwise have been killed off, but the development of all possible deteriorating characters, with some possible grains of wheat amidst much chaff, which, because they have pedigree to their name, escape final destruction. They are *all* devoted to the breeding pen—with a handing on, to generations yet unborn, of all the worst accumulating predispositions of the germ-plasm. This is one illustration of the influence of the principle of *panmixia* which all must appreciate and admit.

Eimer's allusions to the gradual change in the skin to dark color, in the successive races met with in traversing up the region of the Nile, and of the days of Constantinople, etc., appeal to us as examples that could be much more lucidly explained in the terms of variations originating in the germ-plasm.

Weismann's Views on Environment.—It will be interesting to read now what Weismann has to say on this class of cases: "I only know of one class of changes," he says, "in the organism which is with difficulty explained by the supposition of changes in the germ; these are the modifications which appear as the direct consequence of some alteration in the surroundings. These changes—such, for example as are produced by a strange climate—have always been looked at under the supposition that they are transmitted and intensified from generation to generation, and for this reason the observations are not always sufficiently precise. It is difficult to say whether the changed climate may not have first changed the germ, and if this were the case the accumulation of effects through the action of heredity would present no difficulty.

"Increased nourishment not only causes a plant to grow more luxuriously, but it

Digitized by Google

alters the plant in some distinct way, and it would be wonderful indeed if the seeds were not also larger and better furnished with nutritive material. If the increased nutrition be repeated in the next generation a still further increase in the size of the seed, in the luxuriance of the plant and in all other changes which ensue is at any rate conceivable if it is not a necessity. But this would not be an instance of acquired characters, but only the consequence of a direct influence upon the germ-cells and of better nourishment during growth.

"A similar interpretation explains the converse change. When horses of normal size are introduced into the Falkland Islands, the next generation is smaller in consequence of poor nourishment and the damp climate, and after a few generations they have degenerated to a marked extent. In such case we have only to assume that the climate which is unfavorable and the nutriment which is insufficient for horses, effect not only the animal as a whole, but also its germ-cells. This would result in the diminution in the size of the germ-cells the effects upon the offspring being still further intensified by the insufficient nourishment supplied during growth. But such results would not depend upon the transmission by the germ-cells of certain peculiarities due to the unfavorable climate, which only appear in the full-grown horse.

"Organs adapt themselves in all their parts to any condition of existence, and behave like a plastic mass which can be molded into almost any conceivable form in the course of time. The cause of this variability lies in the germ-cells from the moment when segmentation occurs, the exact kind of organism which will be developed is already determined, whether large or small, more like its father or mother, which of its parts will resemble one and which the other, to minutest detail.

"In spite of this there still remains a certain scope for the influence of the external conditions upon the organism. But it is limited, and forms but a small area round the fixed central point which is determined by heredity.

"Unhealthy sedentary habits make pale and stunted people, life on board ship makes sailors tanned and strong; but when once the resemblance to father or mother or to both is established, it can never be effaced, let the habit of life be what it will.

"Natural selection, in truth, works upon peculiarities which are hidden in the germ-cells; predispositions fluctuate, and it is on this that the possibility of an increase of the predisposition in question, and its average result depends.

"The source of all the permanent hereditary variations can be traced to the various external influences to which the germ is exposed before the commencement of embryonic life. Hence, we may fairly attribute to the adult organism influences which determine the phyletic development of its descendants. For the germ-cells are contained therein and the external influence which effect them are internally connected with the state of the organism in which they lie hid. If it be well nourished the germ-cells will have abundant nutriment, and if it be weak and sickly the germ-cells will be arrested in growth. It is even possible that the effects of those influences may be specialized, that is to say, they may act only upon certain parts of the germ-cells.

But this is very different from believing that the changes of the organism which result from external stimuli can be transmitted to the germ-cells and will redevelop in the next generation at the same time as that at which they arose in the parent and the same part of the organism. We have an obvious means by which inheritance of all transmitted characters takes place in the continuity of the substance of the germ-cells or germ-plasm." (Essay on "Heredity.")

A Different Interpretation of Old Problems.—"From these considerations it will appear that several of the questions which have been keenly agitated among warm disputants for many years past do not admit of a solution in a way they have contended for." Such is *not* the "conclusion" come to by Weismann, *but* that of last century. Dr. Anderson, who independently reached so completely the goal modern new Darwinists are only yet struggling toward. "The more we reflect upon it, the more serious," says

Digitized by Google

even Professor Osborne to-day, "does the Lamarkian position become."

A Simple Test.—"Most of us," argues Sir William Turner, "can, I think, distinguish the nationality of a citizen of the United States by his personal appearance and without being under the necessity of waiting to hear his speech and intonation." Assuming for a moment that such results were caused as indicated, and that they are, therefore, hereditary, we would expect the same to be implanted in the child of "typical" Yankee parents. Now take such a child and send him to London, Paris or Vienna.

Would we, ten or less or more years, afterward expect to recognize the Yankee before waiting to have him exhibit himself? We guess not.

LIKE BEGETS LIKE.

BY JOS. CAIRN SIMPSON.

THE position I took in a former paper that the coupling of trotting stallions and thoroughbred mares with the intention of securing fast trotters from the "cross" was in accordance with theories founded on logical reasons, and this essay will be directed to proving that the results of practice have fairly established the soundness of the position. And yet, while the practice of breeding thoroughbred mares to fast trotting stallions, or stallions which have been the sire of fast trotters, has increased greatly in the last twenty years, the numbers thus mated have been so small when compared with those of other strains, that, following the rule of proportion, it could not be expected that any great showing would result. There are many of the large trotter-breeding establishments which have neither thoroughbred or half-bred mares in the paddocks, and there are few of that stamp among the dams held by the far larger class known as small breeders, especially in states where breeding thoroughbreds has been limited, and in these later years racehorse regions have covered a very small portion of the country devoted to the production of fast trotters. I write later years, as in the olden times, thoroughbred stallions were in common use all over the eastern and middle states as improvers of ordinary stock. The situation may be better defined by stating that in the first third of the nineteenth century, outside of the breeders of racehorses, there was a predilection for highly-bred stallions among the farming population, which was the main source of supply of driving horses. The only horse-breeding in these days was in connection with agricultural pursuits, excepting racehorses, and, while a large proportion of thoroughbreds were bred and reared by gentlemen of means in some sections, a blood-mare or two could be found on farms of less pretensions than the plantations of the gentry. But outside of these favored countries, where large estates were stocked with highly-bred animals in regions where it is now supposed that thoroughbreds were unknown, stallions were standing in obscure places with many strains of the richest blood of the turf in their veins. All over New England, in the middle and western states, from Maine to the Mississippi, and previous to A. D. 1840, animals of that class were scattered over the country. Anyone who can secure a reading of the old papers which contain a record of the oldtime horses and the sales made by the old-time breeders of racehorses, can verify the truth of this statement, and from that perusal will learn that sons of the oldtime champions of Long Island courses were domiciled in Maine, in Vermont, sprinkled over states where horse-racing was not tolerated, and they will crop out in places where it was thought a thoroughbred had never been seen. History will endorse that much, and when history is silent, old men may be found who will recall the bills on the doors of blacksmith shops, on the sides of stables connected with old-time country taverns,

Digitized by Google

and who can remember the traveling stallion, so carefully dressed, and the proud groom who had him in charge.

One of my earliest recollections of horses, and which has left so vivid an impression that the scene is reproduced with startling fidelity after the lapse of more than fifty years, was a big grey horse which a man led behind a wagon. Nearly white, his coat flecked with small red spots "flea-bitten." and of such proud carriage that his style and unique color caught my boyish eye as one of the grandest horses in the world. Years afterward I told his owner of the impression, and he waxed eloquent over the portrayal of his many good qualities. He was a grandson of Messenger, and he left a valuable progeny, many of which were taken to New York by dealers in the fine horses of that era. That was in northern Pennsylvania, a rough, hilly county, but with fine pasturage, and the farmers who were "well-to-do" kept a few mares which performed the double duty, farm work and suckled colts, the best of which were sure to find their way to a city market. A chestnut, "said to be" a son of Eclipse, is another which is not obliterated from the convolutions of my brain, but next to the stately grey in my recollection is a smoothly-made bay, as "handsome as a picture," though it must have been ten years later when he came on the scene. This was John Bell by Shark, his dam Kate Kearney by Sir Archy, and a stage proprietor, who owned one of the lines running from New York to Owego, the route traversing that part of Pennsylvania, brought him there trusting that the farmers would use him, and that the offspring from the "common mares" of the country would be valuable stage-horses. Not many availed themselves of his services, however, as he was undersize, but in a conversation with a son of his owner last May, he told me that a strain of that blood was fully appreciated now. I give these illustrations to show that even in a country so remote from "racing centers," so rough in its surface, and where a great deal of farm labor was performed by oxen, owing to many of the fields being so thickly set with stumps that a yoke was much handier than whiffletrees, there was a good deal of "blood" disseminated, and that the "unknown" which is so conspicuous in the tabulated pedigrees of many of our fast trotters, is more likely to have a thoroughbred strain than any other.

While old records, difficult of access, and old recollections will establish the claim that thoroughbred blood was to be found all over the horse-breeding sections of the United States, there is ample testimony to prove that it was the prevailing type in the country stallions of districts which are not classed as nurseries of racehorses. Western and Northern New York, Ohio, Indiana, Illinois, Michigan, Wisconsin and that part of Iowa contiguous to Dubuque. If not regarded as the homes of thoroughbreds, these were small racing centers where thoroughbreds congregated to take part in the regular meetings of these old days, on grounds that are now in fields, parts of towns, and where at present gallopers are only a recollection of the oldest, the very oldest inhabitants. Many thoroughbred sires and a few dams were left in the sections where racing was a feature, and as early as 1838 racecourses were quite numerous in the states named, while in that year there were race reports, published in the *Spirit of the Times*, from 104 different racecourses in the United States and a few from Canada. Of course a large majority of these returns were from the border and southern states, but enough of them from the northern and western states to prove that racing was in favor in all parts of the country excepting New England. But in all of the New England states there were the same preferences among the farmers as I have shown existed in northern Pennsylvania in regard to highly bred stallions and a few of the best of their progeny were reserved entire.

It appears to be plausible then that in considering the stock from which fast trotters have sprung, the prevalence of thoroughbred blood outside of known channels, should be accepted as testimony, and it is a just inference that it has exerted an important influence in molding the form of those a part of whose ancestral history has not been

Digitized by Google

lisclosed. Taking this view of the subject and the query will naturally be presented: what evidence is there to justify the plan that the blood of horses which took an active part in the races of fifty or more years ago is the patrimony of animals, the genealogies of which are in part unknown? The answer will be resemblance. A prominent likeness to the stock which proves the inheritance to be legitimately due, and in accordance with the axiom which is taken for a caption, a sensible argument. "Like begets like or the likeness of an ancestor," and when after a thorough investigation the discovery is made that the fast trotters of to-day had prototypes, so far as form and physical characteristics can afford comparison, in the country of their progenitors, there is a better groundwork for the belief in consanguinity than physiologists advance to prove relationship between peoples in different quarters of the globe, with oceans intervening, and not a syllable of history to show that there could be the most distant kinship. A comparatively clear case. Fifty, sixty, one hundred years ago there were horses which tallied with those of the present in physical conformation, which had alike nervous attributes, or more properly described, the same nerve force, the main difference being that later generations have been educated to display their physical and nervous energy at gaits which were not cultivated in the days of their g. g. g. g. g. sires. Let us go a little further, and, since the time which marked the éra when highly-bred stallions were in vogue, there has been a "dark age," which has suffered records to become traditions, and in which even remembrances were indistinct. The farmers who had bred mares to sons of Diomed or Messenger had sold the pick of the offspring to dealers, men who did not care a —— for pedigree so long as the animal was satisfactory. In the former, if he made any note, he was well satisfied to mark on the old-fashioned almanac the date of service, and the calendar for next year would show the day on which the foal came, and it may be that a search among old garrets might bring to light scraps of horse history which would tell how little attention was given to preserve a record of events connected with horse-breeding in those primitive days. The almanac, rescued from the barrel in the garret, might show that the daughter of the cherished old mare was foaled on a certain day, barely possible that it contained a record of her sale and transfer, but after that all traces lost, and yet if the knowledge were obtainable it would fill the unknown "gap" in a pedigree. Emasculation prevailed in those days to a greater extent than it does now. Colts which were kept entire had to possess extra form and good size to save them from the knife. Stallion fees were small, and the only inducement to preserve home-bred animals was decided superiority. Geldings were sought for city markets, and the increased trouble attending the care of stallions was a drawback which few farmers cared to assume. As stated before, there was a preference for higher breeding than could be claimed for those from mares in their own neighborhood, and consequently home products were overshadowed by stallions from a distance, so that, taking all the impediments into consideration, it is not at all surprising that relationship to the notabilities, and that meant with more or less racing blood, secured the bulk of the patronage.

There is another phase of the question which has an important bearing on the subject before taking up the line of resemblance between the oldtime trotters and the oldtime race horses. In the vicinity of New York some attention was paid to breeding fast trotters previous to 1839. In parts of New Jersey, in sections of Vermont, and others of the New England states, farmers sought the best crosses to breed animals which would find a ready market in the cities, New York being the most important point for the sale of speed at the trot. The get of Messenger being uniformly good travelers, drew the first attention to the necessity of selection in this branch of horse breeding as well as that in which the fast galop was the object, and the sons of Messenger, especially his thoroughbred son Mambrino, gave proof of the advantages which would follow selection. But there was as yet no systematized attempt to breed fast trotters, and like the instance

Digitized by Google

quoted, where a stage proprietor endeavored to have the farmers of the county in which he had his residence breed to a horse that would be likely to beget the kind of horses he sought for his stage lines, in place of becoming "big breeders," gentlemen interested in promoting improvement in stock breeding directed their efforts to have farmers cooperate by using stallions which possessed the qualities they desired to have perpetuated. One of the very first moves toward the generalization of trotting breeding, the first so far as my knowledge extends, to widen the area outside of the northeastern section of the United States was made in 1840, when John W. Hunt, of Lexington, Kentucky, purchased through William T. Porter, editor of the *Spirit of the Times*, Abdallah and Commodore, and their description copied from the *Spirit* of February 22, 1840, is well worthy of quotation:

"With a view to improve the breed of carriage horses in Kentucky, we have recently purchased for Mr. John W. Hunt, Esq., of Lexington, two of the finest trotting stallions at the north. One of them, Abdallah, is well known as the sire of some of the best trotting stock in this section of the country. He was bred by John Treadwell, Esq., of Jamaica, L. I., the "Napoleon of the Trotting Turf," and was foaled in 1826. He was got by the celebrated Mambrino (the son of Messenger) out of Mr. T.'s equally celebrated mare Amazonia, who for ten years or more had no superior on the road. Abdallah is a beautiful bay, without white, fifteen hands three inches high. He was slightly trained at four years old and was considered the fastest horse on Long Island; no purses being offered at that time for trotting, Mr. T. put him in the breeding stud, where he has proved himself a sure foal-getter, and won the highest reputation as the sire of hard-bottomed horses of uncommon speed and courage. With the exception of Andrew Jackson, for whom $5,000 has been refused, Abdallah is the finest limbed and most bloodlike trotting stallion we ever saw. For one of his get, Lady Blanche, $2,000 has been refused. Abdallah has stood in New Jersey or on Long Island since his four-year-old year, and the prices his colts command, for road and carriage horses, over those of any other stallions show conclusively the estimation in which his stock is held in this city. He is entirely free from blemish of any description, and unusually kind and good-tempered, as are his colts. He is a gallant-spirited horse, and his action is uncommonly fine.

The other horse, Commodore, was bred by Col. Benjamin Albertson, of North Hempstead, Queen's county, L. I., and foaled in 1828. He was also got by Mambrino, his dam by True American, a son of Volunteer, who was got by Imp. Messenger, grandam by Tom Bogus, imported by General Bourgoyne, of the British army. Commodore is believed to have more strains of old Messenger in his veins than any horse remaining on Long Island. He is a rich blood bay, with no other white than a pretty star, and over sixteen hands high, of immense substance and power. He is a horse of noble presence, and unusually fine action. He has never been trained, but is broken to harness, and perfectly gentle, though of great spirit. His natural gait in trotting or walking is rarely equaled, and it is believed that no son of Mambrino living can compare with him in size, color, shape, strength, blood and action combined. He has been standing for several years near this city, and is known to be a sure horse, while his get are almost invariably colts, and bays at that. His stock is held in high estimation by the breeders of Long Island, where everything in relation to himself and his get is well known."

After anything but a complimentary description of the "common horses" of Kentucky in which they are painted as "wishy-washy brutes that are too slow for anything but to tire themselves, too weak to travel, and too lazy even to run away," Mr. Porter gives some valuable information regarding one of the greatest, the greatest, in fact, of all trotting progenitors with the exception of his grandson, Hambletonian.

"By-the-bye, entire sons of Mambrino are becoming very rare; we do not think there are more than two or three of much promise remaining, if so

Digitized by Google

many, either in New Jersey or Long Island. Some ten years since, twenty-five were brought up at one time, for the British government, and shipped to the West Indies to improve the breed of cavalry horses, while constant drafts have been annually made upon those in this vicinity for the western part of the state, Vermont and Maine. It is notorious that the carriage horses from these states command twenty per cent. more in the markets of the Atlantic cities than those from any other section; it is from thence also that we derive a majority of the horses on the trotting turf of this city and Philadelphia. A pair of "northern horses"—referring to the breed mentioned—it is well known go in more style, are handsomer, hardier, better travelers, and better broken, than any others in the Union. A person with an ordinary eye to the points and action of horses, will recognize a northern horse at once in Carolina, Georgia or Louisiana, notwithstanding they are generally disguised by being neither fed nor groomed so well as they are here."

The popularity of the sons of Mambrino, is shown by the "annual drafts" for those parts of the country, which was the main source of supply of carriage horses and fast trotters, and if other testimony were needed the fact that two of our greatest families of trotters, Hambletonian and Mambrino Chief, and several other branches which have gained distinction, originated from that son of Messenger, the favoritism of that era has been amply justified by subsequent records. William T. Porter describes Abdallah, as "with one exception, Andrew Jackson, the finest limbed and most *blood-like* stallion" he ever saw, and as Mr. P. was conceded to be an authority on form and breeding, the form of the highest type of the thoroughbred was "closely approximated" in the configuration of the two foremost trotting stallions of that day. While their dams had "unknown" for a label on the trunk and branches of their genealogical trees, the sire of Abdallah was clear, and of Andrew Jackson, the produce of a mare by Bond's First Consul and the imported Barb Grant Bashaw.

Messenger blood was claimed for both dams of these celebrities, but it can not be called a "vain presumption" when the claim is made that under the well-known favoritism for the thoroughbred which prevailed in the region of their birth, there was a greater likelihood of that being a component than coarser strains ignored by breeders of carriage horses and providers of the stock which graces the "trotting turf" of New York and Philadelphia. It is a significant fact that these two *blood-like* stallions so prominently figure in the pedigrees of the fast trotters of to-day that it is difficult to cite one of any prominence which does not show the inheritance from one, several of the best a combination of the blood, and many of the very best with later infusions of racing strains.

It will not be entirely foreign to the purpose of this article to present further evidence to prove the preferencs for thoroughbred blood at the time when Abdallah was sent to Kentucky. In the spring of 1839 eighty stallions in all were advertised for public service. Seventy-eight were thoroughbred, one an Arabian, the other a mixture of Arabian and Barb. There is so much testimony to prove that inbreeding to favorite sires was also practiced to a degree that has thrown discredit on many of the oldtime pedigrees. Lady Suffolk and Hambletonian are examples, but as not nearly so much attention was given to keeping the records of trotting genealogy as prevailed in racing circles a table of Ariel's progenitors is given, to show the inbreeding to Messenger.

- Ariel
  - Eclipse ..
    - Duroc.
    - Miller's Damsel by Messenger.
  - dam.
    - Financier
      - Tippoo Saib.....
        - Messenger.
        - dam by Messenger.
    - Empress..
      - Baronet
      - dam by Messenger.

Ariel was one of the greatest racehorses of her day; she was foaled 1822, ran fifty-seven races, winning forty-two, seventeen of them at heats of four miles. Still closer inbreeding could be shown by referring to Sir Archy, where in two well-known instances he was mated with his own daughters, and the progeny became celebrated, therefore there are no substantial grounds for discarding a pedi-

Digitized by Google

gree merely because there is a repetition of names. Inbreeding to Messenger through his sons and daughters, and in later generations, had doubtless a potent effect in establishing a type which was favorable to fast-trotting action, and that type still prevails in all the families which trace their lineage to the patriarch of American trotters. The oldtime trotters which I have seen, or a majority of them, had the "blood-like" appearance which William T. Porter declares that Abdallah and Andrew Jackson carried. Somewhat coarser and more angular from "rugged hips" and prominent shoulder points than the thoroughbred of the present time, lacking in finish, less quality, but plenty of substance, and lots of vim and spirit. They were a sturdy race, and so were their thoroughbred progenitors, as contemporaneous descriptions will show, and in that era of heats and heats of long distances, too, when a full share of renown could only be won by capacity to withstand the most trying ordeals it could not be otherwise.

That many of the oldtime trotters were highly bred is so well-known that it would be a waste of space to quote *in extenso* from the oldtime records. Where the breeding was unknown it can be inferred, that owing to the prevailing fancy for thoroughbred and part-bred stallions among the farmers of the country, there was a better chance for that blood being a component than that of strains which had none of the characteristics of blood.

Up to the time when Abdallah was sent to Kentucky little attention had been given to breeding horses for the specific purpose of track use. In fact quite a proportion, if not all of the famous horses of long ago, were favorite driving horses of their owners, only taken from the road for a short time previous to engagements in purses, or when matches were made. Many important matches were decided on "the road," and less than a half a century ago the Bloomingdale, Third avenue and Haarlem lane were the grounds on which many contests were decided, not unfrequently with quite an amount at stake. But Mr. Hunt had anticipated the time when Kentucky would pay attention to breeding that class of horses and in response to an offer from New York, sold Abdallah after the close of that one season, 1840. In *The Spirit* of September 5th, 1840, is the following note: "*Abdallah*—this fine son of Mambrino, which was purchased last spring for Mr. Hunt of Lexington, Ky., has made a very fine season there. There are those of his four-year-olds here which will be matched for $1,000 each, against the get of any other horse in the Union. His stock is worth twenty per cent. more for the road and trotting turf than any other in this vicinity, and if his present owner is willing to dispose of him we can obtain for the horse on Long Island more than double the price originally paid for him."

During that decade small progress was made in systematizing the breeding of fast trotters, the prevailing impression being that although there were sires whose get were more likely to inherit the proper action, chance had so much to do with the result that it was a lottery of the most uncertain kind. But events were becoming crystalized, the vague forms which had tumbled about in apparently inextricable confusion, began to take shape. Whether chance turned the kaleidoscope or whether it was guided by a skilful hand so that the uncouth figures took symmetrical shapes it is needless to discuss. Two years previous to the birth of Abdallah, Bellfounder was imported and the union of this blood resulted in proving the product of all mixtures for fast trotting action, a leaven which has permeated and made fruitful wherever it was introduced. Another name must be joined to those of Messenger and Bellfounder when the imported foundation for fast trotters is the subject, that being Grand Bashaw, a Tripolitan Barb, as all three of these strains are united in two of our greatest families, George Wilkes and Electioneer, with a double mixture of Bellfounder in the last named and Nutwood, though in the Wilkes, Electioneer and Nutwood tribes there are many lines of the patriarch, and in Nutwood was additions of thoroughbred to re-enforce those which were so potent in the first third of the nineteenth century. In following the line of argument which I have marked the appearance of the horses

Digitized by Google

which laid the foundation for a rate of speed altogether beyond the anticipations of the most sanguine, is important. As has been shown by the quotations from the *Spirit of the Times* while Abdallah was "blood-like," Andrew Jackson had a still greater likeness to the type. This was to be expected from the breeding as the namesake of "Old Hickory" was by a horse which Frank Forrester endorsed as thoroughbred, and in writing about the noted trotting sires of the time uses the following language:

"Andrew Jackson, the most celebrated trotting stallion of his day, was by Young Bashaw, out of a granddaughter of Messenger. Young Bashaw was by Grand Bashaw, his dam Pearl, by First Consul; grandam Fancy, by imported Messenger. This blood is good enough, one would think, to content anyone; as Andrew Jackson himself had at least three-fourths of thoroughblood." The only description I can recall of Bellfounder is one that is colored so highly that it may be taken as one of the most florid specimens of studhorse hyperbole, but in all probability it had some foundation, and a part of it is copied from *The Spirit*, April 25, 1840:

"I was among the first who saw this peerless horse, Bellfounder, after his landing in Boston in 1823, and am well acquainted with the distinguished and public-spirited individual (Mr. James Boot), who, with great difficulty and a very extravagant cost, succeeded to secure and bring him in safety to this country. * * * * I am free to say that in compactness and symmetry of form, in strength and activity, in color, animation and style of movement, and in substance and endurance, he not only stands without a parallel amongst us, but far excels all others which are scattered over the face of this wide extended country."

But in the same journal, March 21, 1840, there appears an article written by A. B. Allen, a practical stockbreeder, and one who was well versed in horse lore.

The article is a sensible one all through, though I will confine the quotations to the part which bears on Bellfounder, and although he does not give a description of the old horse, that of one of his sons will be of interest.

"New York, probably, combines a greater excellency of *practical* blood than any state in the Union. She has had her Duroc, her Mambrino, her Messenger and Eclipse, and lastly, her Bellfounder, a pure-blooded, imported trotter of great and deserved celebrity as a stock horse, having been used for the last twelve years on Long Island and the Hudson river counties. From a combination of these she annually produces a large stock of serviceable animals, unsurpassed and unsurpassable. Many of them sell, as soon as fitted for market, for $200 to $500 for actual service, while some of the fancy and fast goers bring from $1,000 to $3,000. * * * * Bellfounder was bred by T. T. Kissam, Esq., on Long Island, N. Y., was got by imported Bellfounder, the Norfolk trotter, his dam Lady Allport, by Mambrino, her dam by Tippoo Saib. * * * The present Bellfounder was foaled in June, 1830, and when five years old trotted over the Harlem course, New York, a fraction short of a mile in 2:45. * * * Bellfounder's color is a dark dappled bay, a small star in the forehead, one white foot, black legs, mane and tail. He is sixteen hands high, neat head, fine arched neck, short strong back, with deep chest, long under the belly and powerful, well-developed stifle, legs moderate as to length, joints strong, compact and well-knit, smooth flat legs, with a pastern elastic, but shorter and stronger than that of the racer. His weight in ordinary flesh is 1,200 pounds, and it is confidently believed that he possesses all the requisites for service, so well enumerated by Judge Beatty." The Bellfounder described by Mr. Allen was the sire of the grandam of Belmont, sire of Nutwood, and he certainly in many respects had a blood-like appearance. Lady Allport, in addition to being a granddaughter of Messenger, was also a double great-granddaughter of that horse, so that she was half of that blood, just as much as though she were an "own" daughter. Like begets like, and while the shorter pastern in Brown's Bellfounder may have come from the blood of the Norfolk trotter,

Digitized by Google

one-quarter of that strain being his inheritance, it must also be borne in mind that breeders of carriage horses in those days were partial to a short bone between the foot and ankle and in selecting blood sires made that a point. Then the blood-horse of fifty years ago has been improved, and though "substance" may have been in a slight measure sacrificed to "quality," when speed is the test the change has proved beneficial. Just so sure as that the removal of bulkiness, when that was an incumbrance, has added to the speed and endurance of racehorses, just as certainly will it inure to the advantage of fast trotters. and I would be better pleased with animals intended for the tracks, the forms of which have a closer approximation to those of racehorses of the present than their coarser progenitors of half a century ago.

Oakland, Cal., November 7, 1892.

SYSTEM AND ENERGY.

BY RAY MARSHALL.

THERE is lack of energy on many stock farms. In this respect the management is more often at fault than in any other. With the general farmer this is evident in the neglect of the growing colts. During the next three months on many farms there will be much leisure time. The farmer himself, his sons and hired men, will go to town and to make calls on the neighbors on errands of business or pleasure; and in the majority of instances will drive or go on horseback with the animals that are entirely trained and accustomed to work. This habitual custom results from a preference for ease and comfort as compared with the petty annoyance and somewhat disagreeable task of handling partly broken colts. Of course in such cases it would sometimes be advisable to remove a saddle or unhitch the animals from their vehicles when tying them.

In the case of young men during the long evenings of winter and the frequent idle hours of the day, energy applied with system in this direction could accomplish wonders. It is true that there would be risk for one person to go out alone in the evening with an unruly colt. It requires, however, only a little forethought for two neighbor boys to plan a ride together in the evening, one of them having a steady steed if they go on horseback. There is usually little risk in giving a partly trained colt working exercise in a team with a steady mate. It is not requisite that a great amount of work be given to a three-year-old colt in any one day. It is far better that it should have not more than five miles of travel on the road each day for a week, than that it should be driven half this total distance in a single day. It is a fact that has been noted in former articles that the average colt needs rather frequent handling in short spells. It is the harnessing, hitching and driving short distances, and the unhitching at destination (at both ends of a journey we mean) that are of particular value, and it is important that most of these trips be short and that the handling be duly appreciated. The very thing which the average man dislikes about working and training colts is just that which needs most to be done. It is true, of course, that when a colt is first harnessed, after some preliminary bridling, bitting and handling, it should have very careful attention in good daylight, there being at least two persons, with reasonable judgment about handling colts, present during three days or a week. As a rule, too, it is safer that methodical care be exercised in daylight for a month in the handling of such colts. As a rule, there is no serious occasion for this special training of the young equines at night-time during the long days of summer. It is desirable, however, rather than that the colts three years of age should not be worked at all, that they be exercised, after they have been first specially trained, and this work performed at evening hours. The horse must learn the ways of work;

Digitized by Google

and its bones, muscles, etc., should be hardened for its labors by frequent labor in moderate instalments.

It is by far the wrong policy to follow the old custom of devoting a week to breaking the colt during the muddy days of spring and then work it very hard in the plow or harrow; then after the planting season turn it out to graze and recuperate its wasted flesh and strength, and allow its bruised neck and shoulders to heal. Previous to such spring work the daily installments of light work in winter which tend to harden the animal are especially desirable. In the heavy ploughing or harrowing of spring time, if used at all, the youngster should be one of three in a team, drawing a load ordinarily requiring but two substantial beasts. In such cases if there can be two young horses to alternate in such work, morning and afternoon, with two older horses, it is appropriate that this policy be followed. It is probably true that more of the disposition to balk grows out of this cruel practice of overloading young horses, and putting upon them tasks which are absolutely beyond their physical strength than from anything else. If a farmer has but one colt to work at such times, it is far better to favor it if possible by working it but two hours in the morning and three hours in the afternoon as a third horse with a stout brisk team. The exception must be noted at times, in the case of staid, slow work-horses, that the colt may be fretted and too much annoyed by their slow gait. With the average work-horse, however, in many cases, the youngster can be benefited, where not over-sensitive, by working in company and learning by actual imitation to keep pace with the stout team and to pull persistently, and walk with a load at a moderate gait. Of course it needs only a suggestion that the colt as a third horse should be given the advantage of draught in the double-tree.

The foregoing suggestions apply specially to men and boys who are thoughtful and observant of the manner and habits of the equine race. Much discretion must be employed, as there are innumerable accidents and freaks to be anticipated and, if possible, warded off, by the foresight which every careful horseman is ever on the alert to exercise. The farmer who is particularly an adept in training and mastering his colts, will carry the work farther than is suggested above. On those farms where it is the regular practice to grow a half dozen teams, or even a smaller number of youngsters per year, after the colts have been carefully worked in moderate light daily tasks during winter, the three-year-olds and those a year older of only moderate size, will be hitched in pairs with an older, stronger team in the heavy work in which two steady, stout work-horses will be accompanied by two younger colts that will be worked but half the day, thus learning to do regular work, and by alternating be relieved from the burdens of long hours. By such half-day instalments two young teams could be maintained in spirit, and at the same time made steady for work; and such exercise would be of particular value in teaching them to pull steadily in the quiet of the field. An effort to drive such young teams to a load, even though only a comparatively light one on the road, might not be so effective in teaching them as the former-mentioned practice. There is an inspiration comes to horses as well as to men in working in company, and judicious work of this kind can be made profitable as well as economical. It is desirable that one planning this course should anticipate well the difficulties by consultation with those who have had some such experience, if possible. It would require volumes to go into all of the details, the extensive mention of which would prove tedious at this time.

There is danger, of course, of overreaching in one's plans, and the energetic, conservative man will make haste slowly in adopting a practice with which he is unfamiliar. It is true, however, that one must have a plan, and that to accomplish anything on a stock farm in training the horse stock, risks must be taken to some extent. With modern appliances, however, to protect the driver, the risks are reduced to a minimum. It is particularly important to one who works a partly trained team of young horses with another pair, in a group of

Digitized by Google

four, that there be precaution against kicking on the part of the younger pair. Nearly every farmer knows now how to apply kicking straps to protect himself. The average man is not careful enough in this respect. It is very desirable that in such cases one should have all the advantage when even the staid and tried team is not any too safe in the emergency arising from the unruly actions of the younger pair of a team of four. There are numerous other exercises for the young team on the farm which we shall probably mention in the future. At the opening of this new year there should be a resolve on the part of every farmer who has two-year-olds and three-year-old colts, to begin with energy to teach them a little every day. If they are only taught to stand tied in the barn during the first fortnight, much is accomplished. If within the next fortnight they learn to lead and to allow the harness to be laid upon them and fastened about them without resistance, one may feel that he is making progress in training a horse for the future. It must be remembered all along that it is not so much the amount of work that a colt does during a month as the doing of a little every day, and the doing that little right.

THE MANAGEMENT OF STOCK FARMS.

SOME most excellent articles have appeared of late in the MONTHLY on this and kindred matters, and the perusal of these leads us to further discussion of the subject. While it is hard to find fault, even if one were ever so disposed, with the way in which many of the successful stock farms are conducted, more especially those devoted to the breeding and training of the light-harness horse, it will do no harm, and possibly some good, to endeavor to present some things which appear to me to be of interest to all who are engaged in breeding and training trotters.

At this season of the year the horses are home from the circuits and have brought with them in addition to laurels, money (or defeat), tucked-up flanks, legs possibly the worse for wear, and, in many cases, a waspish disposition. The tucked-up flanks tell of hard days on the track, hard oats, hard condition, and, quite often, hard tempers. It must be our first care to see that we get the digestive organs of our horses into such shape that they will be in a fit condition next year to assimilate their hard food when we begin to make speed and condition again. The small feeds of oats and the still smaller supply of hay has served to contract the horses' stomachs until their size is not adequate to take care of the roughage with which we propose to feed them during their winter's stay at home. A careful examination of legs and feet must be made, training shoes and plates must be taken off, and comfortable, roomy shoes put on in their places. Some people think that it is best to commence to repair damage sustained during the season at once; but we believe it is better to attend to the digestive organs first before anything else is done, save to remove the shoes as stated.

The horses should, of course, be provided with good, roomy boxes and a paddock in which they may range at will on fine days, or at such times as they may see fit to take a run by themselves. To begin to increase the capacity of the stomach our first agent to be used is bran, and to a slightly decreased oats ration we add a couple of handsful of this feed stuff and as many of cut or chopped hay, which insures perfect mastication, and the bran has a soothing and loosening effect upon the bowels. In a day or two we may add a couple of tablespoonsful of oil meal or a bit of oil cake. Again in another day or so we may dampen the whole, and in a week we may scald the oats and increase the amount of bran and the oil cake. The scalded oats has swollen in the process, and while we have given the same measure we have given less grain and more bran. The ration is very easily digested and the stomach can readily take care of it, the distention being relieved speedily by quick digestion. Almost immediately a very small quantity of boiled barley

may be added and this may be increased for a time until at the end of two weeks we have changed the entire diet from hard, clean oats and hay to one of boiled barley, bran, cut hay and a little oil meal. If it is desired a little crushed oats may be added to this mass and the whole well dampened and fed hot or cold. This will be found to be easy of digestion and very beneficial to the general health. If undue looseness of the bowels follows any change we are going too fast, and the graduation must be made on a more extended scale. As a general thing, however, no trouble will be experienced in this line. We have by this time gotten our horses to eating at least four times as much bulk as they were at the time they came home, we have gotten the stomach distended and the presence of the cut or chopped hay insures us perfect mastication and no bolting of the grain.

After a time when the digestive organs are found to be in perfect condition, which will surely follow, we can feed one feed of dry oats a day; thus gradually we can bring the animals back to a hard diet again before their winter's rest is completed, and we will have them hearty and strong for their spring work. During the summer they may have been eating the very choicest of timothy hay that money would buy for them, and a very small quantity of it. Now we must see that they get a variety, if possible, of roughage, so that they may be induced to eat as much as possible of it and so distend the stomach and intestines, and help in that direction the soft food they are getting. Sweet corn fodder, cut early and cured pretty green, is excellent, and a ration now and again of marsh or upland prairie hay will frequently be greatly relished by some horses. Some advocate the keeping of roughage before the horses all the time and letting them eat of it at their own sweet will. We are not sure that this is attended by the best results, and consider that it is better to feed them a good big bunch of whatever we have on hand morning, noon and night. We have found that the feeding of the grain ration as advocated above is best done three times a day after the animals have been gotten onto a full feed of it. About ten o'clock in the forenoon a ration of carrots or Swede turnips may be given with great advantage, more especially if the animals have not the run of a dirt lot or pasture. The earth adhering to the roots, as well as the roots themselves, seem to supply something to the stomach that is beneficial. In starting draft horses, that have gotten into bad condition, up again, through scant feed, hard work and improper care, I have pursued this course and I have never known of it failing to produce the very best results with them, as well as with trotters home from a long, arduous campaign. Some people of my acquaintance go so far as to feed their horses four times a day, at five or six A. M., ten, two P. M. and at six again. I question very much the wisdom of this, as I think a horse can take enough at one meal to satisfy his bodily cravings for repair, fed three times a day. In thus seeking to repair the horses' digestive organs we must always bear in mind that no two horses are alike, and that what may succeed admirably with one will fail with another. We must therefore watch each animal closely and endeavor to find out his or her capacity and then govern ourselves accordingly, regulating supplies so that the best ends may be obtained. The old system of so much of this and so much of that at a feed, irrespective of age or condition, should not be longer tolerated. Watch each animal closely and see that its wants are supplied according to its capacity.

During this time it is probable that some of the horses may be attacked with colic. It is astonishing how many animals die annually from this disease and its after effects if it is not taken care of at once in a prompt and efficient manner. Not so long ago I made an examination, by permission, of the causes of death of some horses on which an insurance company had paid the sum insured for, and I honestly believe that at least fifty, if not sixty per cent. could be traced directly to colic of one kind or other. If taken promptly in its earlier stages colic is by no means a hard thing to combat successfully, and it is right to keep on hand some simple colic remedy where it can be readily got at and administered

as soon as the first symptoms appear. There are a hundred different colic cures advertised, some of which are of no use and some of which are quite good. However, the following will be found to have the endorsement of all qualified veterinary surgeons, and can be put up at all country drugstores:

Hyposulphite of soda	4 oz.
Laudanum	1 oz.
Turpentine	6 drams.

Water to make a pint. Give as one dose; repeat in half an hour if not relieved.

The above administered as a drench will generally allay all pain, and warm water injections should be given copiously. Some people make the mistake of considering that as soon as the symptoms of colic have passed away under the above or any other treatment all danger is past; such is not the case, and a pint of linseed oil, or better still an ordinary beer bottle full of the same should be given in about two hours after the pain has ceased. This will cleanse the bowls and remove the cause. Raw linseed oil is very harmless and is to be preferred to an aloes ball in almost all cases. For spasmodic colic the following may be given and will be found to be equally as good as the former prescription is for flatulent colic:

Linseed oil	1 pint
Cannabis indicus	2 drams
Laudanum	1 oz.

Give as one dose and repeat two hours if the pain has not ceased. Do not give over three doses. Give warm water injections liberally.

Spasmodic colic lasts longer than the flatulent variety, and its symptoms are often confounded with those of other diseases. In each case warm water injections should be given very liberally, which will be found to be very beneficial, relieving the pain and freeing the intestines from surplus matter. The old practice of giving injections with a large syringe is now practically obsolete. A piece of an inch hose pipe, about thirty or thirty-six inches long, inserted into the rectum delicately and then an ordinary funnel placed in the uppermost end, forms a very convenient apparatus into which the warm water may be poured from a pail or other utensil. The end of the pipe and the funnel being held up as high as the attendant can reach and the warm water poured in by another person, floods the intestine with a continuous flow of warm fluid which is much more acceptable than the old method, which was slow and caused the entrance of more or less air into the intestine all the time during the operation. In addition to this, very much more warm water can be introduced in a given time, and as a result relief follows much more speedily. Warm blankets should always be put on the animal, for he is very liable to sweat, and then a cold is the almost inevitable result if the utmost care is not taken. This is often followed by the most serious consequences, pneumonia not infrequently ensuing and ending in death. As this is not intended for a veterinary treatise on colic and its kindred troubles, I will close this digression with the remark that I have frequently administered the remedy and superintended the operation described, and have seen excellent results follow from the treatment. I offer this as my excuse for trenching on the domain of the veterinarian.

So far we have treated only the horses we have had out on the circuit and of their feeding. Now we will proceed to some other matters which will be found to need attention. We stated at the beginning of this article that it was better to attend to the digestive organs first before paying very much attention to repairs which need to be made in "the traveling gear." Having succeeded in getting the health of our horses as perfect as possible, we proceed to repair damages to the best of our ability. It will be found that blisters are much more successful in their operation when the bodily health is all that it should be, and in addition the perfect rest which is absolutely necessary during such treatment necessitates a perfect condition of the bowels, or we will find ourselves in the unenviable position of having to combat an attack of indigestion as well as the changes brought about locally by the application of a blister. Scarcely a string comes home but one of the number and often more, requires his or her tendons blistered or possibly fired. The use of the firing iron is very helpful in some cases, and should be resorted to

Digitized by Google

much oftener than it is in this country as a general thing. When the tendons are effected, superficial cauterization is probably the most rapid road to recovery, and in such a case the firing should be done as close to the knee as possible, drawing the firing-iron—the feathering-iron—downwards and forwards. The extent of the injury will, of caurse, regulate the severity with which the tendon is fired. If the knee joint is to be fired, make a vertical line, then draw your oblique lines, always firing "with the hair." Should any of the horses be "knuckling over" it will be necessary to fire both tendons and fetlock together. If ringbones or sidebones have developed and lameness has ensued—which will surely be the case—use the pointed iron and fire in lines around the hoof, being careful to puncture in alternate spaces in the different lines so that the whole may feel the effects of the hot iron. For low ringbone use the puncturing iron low down coming in contact with the hoof, and the same practice may be observed for sidebones. If it is necessary to fire a hock, that joint should be fired inside and outside, being careful not to go too deep in front. The back tendons in the hind legs are fired very nearly the same as the front, but in this case do not make a vertical line, as it tends to blemish. No set rule may be laid down as to the heat of the iron; experience only can teach what heat is required. Always fire with the hair and be careful in firing a hock not to go too deep. Blisters will be found necessary to set up healthy growth in some parts, and then they should be applied only in accordance with the severity of the sprain. If lameness is present and blistering does not remove it, the blister should be repeated in three weeks. As a general thing it may be said that the second blister should not be rubbed in until three weeks have elapsed after the application of the first.

During treatment "for repairs" the best of care should be taken of the animals. We have seen how their stomachs can be gotten into the best of shape, and in that condition the enforced idleness does them little or no harm. Special attention should be paid to the feet, so that when the training shoes come to be nailed on next spring there may be an abundance of healthy horn to catch the nails. We knew an old trainer of gallopers in England who used to race his horses at the smaller meetings, and on the plan of making them do the bulk of their training in races, who was very successful in a selling-plater sort of way, that used to fix up large sponges with straps and bind them around the racers' feet when he took them home after the flat racing season was over. He claimed that by keeping these wet sponge attachments on during eight hours of the night, for about three weeks, and then applying a gentle, stimulating liniment composed of ammonia and sweet oil, he got an almost perfect growth of horn before the next training season commenced. We know that his poor brutes raced season after season, and that they won a good many of their races, so we suppose he found his treatment successful. Whatever the treatment, due attention should be paid to the feet, always bearing in mind the old adage, "no foot, no horse." The services of a competent blacksmith should always be called in, and at the same time a close watch kept for thrush, and kindred affections.

To leave the horses we have had in training to enjoy their well-earned rest, we will now turn to the stallions of the farm, supposing that we have one or two that have earned their laurels before the last season, and which are intended to do a large amount of service the coming spring with our own, and such mares as may be sent to us. Our chief aim with them should be to keep them in the very best of bodily health and condition, so that they may have the best chance to produce their own desirable images in their progeny. A stallion, to be able to do his best, must be strictly healthy, and in possession of all the vigor which is characteristic of an entire horse. Without this he will be found wanting, both as to the percentage of mares begotten with foal and as to the nature of the foals he does beget. To this end we must see that a sufficiency of exercise is given these stallions, more particularly as winter gets far advanced and spring comes

Digitized by Google

on. Ten miles a day on fine days is not a bit too much for a horse in the full possession of his faculties, and this at a moderate pace, sufficient to send his blood coursing through his veins. We do not advocate driving a stallion at this time of the year until he is tired; but only until his blood is all thoroughly in motion and every nerve brought into active use. His feed must be of the best, and we must keep him in good muscular condition. Some people make the great mistake of considering that a stud horse, to obtain the best results from his services, must be be kept thin. There never was a greater mistake than this. A stallion should not be kept in "hog" fat; but he should have an abundance of muscle, and be fed such foods as will produce it. To this end, also, the amount of exercise specified should be given, and it should be given by a competent and trustworthy man. We knew of an owner of quite a large stock farm, who could not see that it paid him to employ a first-rate man to drive his stallions through the winter months, and consequently he entrusted that part of the business to a lad, who had about as much sense as a cat has use for two tails. He used to hook up the horses, drive them slowly around the corner and then split them out for half a mile as fast as they could go. Quite frequently he used to then turn them around, hitch them at a door of a conveniently-located saloon, and, blanketing them, spend a half an hour shaking dice or engaging in some other congenial saloon pursuit. The result of a blanketing after so rapid a spin was, that the hair on the horses was a trifle "turned," and the owner, little suspecting what was done with them, was satisfied that they had had their exercise in a legitimate way. He was electrified to find one day one of his most valuable stallions tied before the saloon in question, and, dismounting from his saddle horse, entered, to find his man playing billiards or something of that sort. A speedy dismissal followed, and after that a competent man was employed. I quote this instance merely to show that as far as the stallions on the farm are concerned, there is no money in low-priced, inefficient help. The food of our stallions must be such as to promote the best digestion and so the best health. The liberty of a paddock should at all time be given a stallion, and his box should be roomy and comfortably bedded. Roots will be found to be very good for an entire horse, and a feed of them twice a day will not be amiss during the entire winter season.

Our mares and colts are also deserving of the best care, for in them is tied up the prosperity of the farm. No matter how good as individuals or how well bred our stallions may be, if we do not take care of our mares and colts we will fail in giving to the world any of those stars it is the aim and ambition of every stock farm to produce. We must give the mares warm, comfortable quarters, must see that they are free from annoyance of any kind, and that they spend their time in placid enjoyment as befits their matronly rank. Some make a practice of running their mares, for convenience sake, in a bunch; but I believe that it is better to divide them up into lots according to disposition and house each individual mare separately at night. There are sure to be a few which are cross enough to do injury to those they know they can master, and an untoward kick sometimes results in abortion, which causes the most serious results to ensue throughout the entire herd. My experience with brood-mares leads me to believe that the "boss" mare is generally one of pretty quiet temperament, and that those which are forever kicking do little of it if confined to quarters in the daytime by themselves with the "boss." The more timid and gentler ones can be run together, and thus the danger of injury can be reduced to a minimum. The "boss" mare serves to keep the unruly ones in order, as in a small bunch she is almost ever present, whereas in a large lot she is very often far away and the mean ones get a chance to kick at the more timid. With the whole lot running together, scarcely a feeding time passes but some kicking is done, and if the mares are subdivided up into smaller bunches it is more than likely that kicking will be the exception rather than the rule. To secure strong, healthy foals

Digitized by Google

the mares must be well fed; but they must not be kept too fat. A soft diet, such as suggested for the horses after they come home from the circuits is excellent for brood mares, and for the weanlings and yearlings. We know of a farm, from which the youngters bring as much as from any farm almost, where the daily ration consists of boiled barley, bran, cut hay, oil cake, and the run of a lot where free access is given to corn fodder and hay, both marsh and timothy. If good prairie hay were substituted for the marsh we would consider this an almost ideal ration for colts and brood mares, with the oil meal kept from the mares and given to the colts. It is a popular prejudice that flaxseed or any of its products, has a tendency to produce or induce abortion, but we have known farm mares in the far west of Dakota and Minnesota winter themselves at flax straw stacks without any other care or feed, and produce fine, healthy colts in the spring. However, as there are plenty of feed stuffs that may be given without flax products it is as well to respect the popular prejudice and keep the oil meal or cake from the in-foal mares. In-foal mares do not require any more exercise than they will naturally take if allowed the run of a pasture or large lot. It is part of the instinct of any horse to scrape for its living, and if given the run of any large sized lot mares will take exercise enough to keep them in the condition they should be in when they bring forth their foals.

As regards the weanlings, it may be set down as an axiom that the better we do by them the better they will do by us, and it may be accepted as a truism in horse-breeding that the flesh that is born on a foal should be kept on its bones all its life. Generous care of the brood-mare will insure as a rule strong foals, and after the foals come it is quite an easy thing to keep them doing well until it is time to wean them; that is, unless some dire malady such as distemper creeps in amongst them. The foal should be halter-broken just as soon as it is able to stand up properly without assistance, the first lessons being given to an ordinarily healthy foal within three days of its birth. At this time the little creature has not the desire, or even the ability, to struggle much, and so the putting on of the headstall and the tying up beside the mother is by no means a hard job. A few moments is all that is required for the first few times, and it is astonishing how quickly they will learn to run up to their place at feeding time and be tied up for their bite. Some may contend that this is too soon for halter-breaking; to those I make answer that if it were possible to break to harness at the same tender age it should be done, for experience has taught every one of us that the longer any breaking process is delayed the harder it is to perform and the greater the waste of nerve force and muscle while it is going on. Previous to her foaling, the mare should be watched as to the condition of her udder, and proper care taken that it is in such shape that as soon as the foal is able to suck he can get a plentiful supply. In young and fidgety mares it is a good practice to rub the hand over the udder each time one is passing her so that she may get accustomed to having it touched. Serious trouble is often avoided in this way. Of course, food of as succulent a character as possible should be given the mare in order to promote a plentiful flow of milk. Once fairly upon his feet it is surprising how quickly a colt will make flesh if sucking a well-fed mother, and it is also surprising how quickly he will begin to nibble for himself. As soon as he evinces a desire to nibble a little, promote him to the dignity of a feed-box, and place before him a small ration of crushed oats and a little bran. He will not eat a tablespoonful at first, but very soon he will eat up clean quite a quantity. Spring time will of course come on, and then our mares and colts must go to the grass.

And right here is where a great many make a mistake. They turn the mares and colts into the fields and take all the grain away from them. Grass, while it is surely nature's summer food for animals, but illy supplies the place of a grain ration, and with this in view, a small feed should be given to the mares night and morning. The increasing quality of the milk and the better condition of the mothers will more than repay the outlay. Of course the colts must

Digitized by Google

have some grain, too, and to this end it is best to construct a small pen in the field in the center of which is a conveniently low trough, and the surrounding fence is constructed of strong posts set into the ground, and a single rail, or possibly two, spiked onto them at such a height from the ground that the colts can stop to go under it but the mares are turned away. This trough, kept supplied with crushed oats and bran all the time, forms a sort of reservoir from which the colts will draw a heap of strength. In the full flush of the grass the daily rations of the mares may be shortened a little, but as soon as the grass gets a little short the grain should be increased. Nothing on earth looks worse than a lot of well-bred mares and their foals picking in a bare, brown pasture, the prominent ribs and staring coats of all showing too plainly that what they have to eat has not in it the necessary food elements to prevent gradual starvation. And, besides this, it will be found that it is harder to put a colt in condition than it is to keep him in condition, and much more expensive in the long run. It is a good plan to throw into the field, along in the fall, a ration of green corn, which will be found to supplement the pasturage admirably, and form a pleasant change of diet which will be relished accordingly. The necessity of keeping the mares and foals in good thriving condition during the summer months can not be too strongly recommended. It is just as important as to keep them in good order during the winter season. There is not one who reads this but has seen mares and colts stamping flies in a bare, brown pasture, looking almost a disgrace to the neighborhood, and any one who has observed what wonders a little grain ration will do in the way of improving and sustaining condition, will fully recognize the force of these remarks. Well-grown youngsters always sell the best, and therefore it means a direct loss of cash to let them fall off in flesh. Another thing that should be seen to is the providing of some shelter under which the animals may take refuge from the fierce rays of the burning summer sun. Many and many a time have we all seen a band of horses driven almost to frenzy by the attacks of the flies, when the outlay of a few dollars would, if put into the construction of a pole shed, roofed with straw, reduce their sufferings almost to a minimum. In the south nature has taken care of this most essential adjunct to a horse pasture by plentifully besprinkling almost the entire country with trees and brush. In the absence of this natural shelter no horse pasture should be without a shelter of some kind, and one constructed as suggested of poles set into the ground, and then a roof made by laying brush and straw on top of these will be found to answer the purpose much more practically than a more expensive structure. The open sides permit the suction of what air is stirring below the roof and this serves to drive off the flies and leave the horses in comparative comfort. If this shed be made sufficiently large and the colts' feed trough be placed in the middle of it, the colts will often spend the entire day there, from 10 in the forenoon till well along in the afternoon, when the rays of the sun have assumed a more slanting direction, and their violence is consequently somewhat abated. These remarks will of course apply in the main to pastures where horses of any age or condition are restrained, and not alone to those where mares and foals are running.

One thing yet remains to be touched on with regard to the raising of colts, and that is the feeding of cows' milk to them. Unless there is some special cause for it, such as extreme emaciation caused by lasting sickness we freely condemn the practice. If such a case crops up, and one or two generally do on each stock farm during the year, it is sometimes advisable to feed milk by hand. In such cases it should be well skimmed and fed warm. We have never known colts fed liberally on new milk by hand that did not develop a great deal of softness, and present a great tendency to unsoundness in the joints, more especially in the hocks. If a mare is lost it becomes then necessary to bring up her foal on cows' milk, which practice often results satisfactorily; but we refer to the feeding of cows' milk in addition to the other full rations.

Digitized by Google

With regard to the treatment of the rest of the young stock on the farm during the winter it may be said that the best of care should be given them; liberal rations of nourishing feed should at all times be supplied them, and a lot to range in at will on fine days. They will play a great deal and take plenty of exercise. We advocate the practice of breaking colts as soon as they are big enough "to fill the harness," and during the fall and early winter many lessons can be given. It is not within the scope of this article to treat of the methods of training employed. That is left to wiser heads than mine. The general principle may, however, be laid down, that the earlier the training is begun, by breaking to halter and to bridle, the more easily are the lessons learned and the less the wear on the animal.

I have endeavored to present some ideas, based on practical observation, as to the treatment of the animals on a farm during the winter and have also commented upon the care of mares and foals during the summer months. At some future time I hope to present some thoughts as to the care and handling of the stallions during the season. We must remember that none of the improved breeds of horses or other domestic animals were given to us through poor treatment, and the principle of good care underlies all steps toward improvement. Hence want of care tends to speedy deterioration. Every dollar that is put into feed for youngsters will bring back two if the money be judiciously expended, and therefore it is the falsest kind of economy to stint the youngsters in the hope of saving a little in feed bills. Such a course is simply zealously guarding the tap, while the contents of the barrel are flowing in a magnificent stream from the bung hole. BADGER.

BROOD-MARE SIRES.

BY L. E. CLEMENT.

EDITOR MONTHLY:

MUCH has been written of brood-mare sires as though they were different from other horses and other sires. There are 139 horses that are not in the great table of sires, that have sired daughters that have produced 470 standard performers to the close of 1891.

Of this number John Dillard, son of Indian Chief, by Canadian Chief, dam by Mack, has 12 daughters with 18 in the list, sired by 10 sires. Red Wilkes, Waveland Chief and Hambletonian 5864 having more than one in the list from Dillard mares. Kentucky Clay, by C. M. Clay 22, dam Rodes mare, by Gano, dam of Mambrino Patchen, has 10 daughters with 15 in the list by 13 sires. Each of these horses, John Dillard and Kentucky Clay, has left one son a sire of a 2:30 trotter, and in the case of Kentucky Clay 5 of the sons of daughters have been more or less successful as sires. Hamlin Patchen 3519, by George M. Patchen, dam by Addison, is represented by some in the list, all but one of them being by Almont Jr. Of the rest of 139 sires little need be said. Mohawk Chief, son of Hambletonian (10), is represented by 12, 7 of them being from the gray mare Sontag Mohawk, 4 by Electioneer and 1 by Norval, and all are by Electioneer and his sons except 1 by Gen. Benton and 2 by Piedmont. If we were compelled to draw our deductions from these 139 sires it would be hard to arrive at conclusions. They were not strong enough, or lacked opportunity to sire speed themselves, and while there are 139 of them, and most of them not likely to be represented at this late day by 2:30 performers, there are about 3,000 sires of 2:30 performers, to the close of 1891. So, comparatively speaking, this little coterie of 139 cuts a very small figure.

At the close of 1891 Hambletonian (10) was not only the greatest progenitor of trotting speed, judged by the records, as shown by the produce of sons and daughters, but was the sire of more producing daughters than any other horse that had ever lived, being credited with 59 that had produced 74 in the list, 73

Digitized by Google

of them being trotters and 129 of his sons had sired 2:30 speed, and the whole 3,000 sires of speed trace almost without exception to this great son of Abdallah and the Hackney daughter of Imported Bellfounder. It is to-day hard to say what proportion of this greatness of the American trotting horse is due to the influence of this same Bellfounder blood. The Charles Kent mare was not only the dam of Hambletonian (10), but she was the dam of the mare that produced Green's Bashaw, a horse that has made a wonderful impression on the trotting stock of the west, but 15 of whose sons had sired 2:30 speed and 22 of his daughters had produced, which is more than stands to the credit of any horse, that was alone able to sire brood-mare qualities. There is little question that if Bashaw 50 had been better placed, or lived in later years, his influence on the American trotter as shown by his descendants, would have been much greater. Fan, the dam of Harry Clay, 45, that sired the wonderful brood-mare Green Mountain Maid, was also by Imported Bellfounder. Next to Hambletonian in the list of brood-mare sires comes Mambrino Patchen, he having 52 daughters, dam of 62 in the charmed list, he was not only the sire of 18 2:30 or better trotters himself but 37 of his sons were the sires of 83 in the list at the close of 1891. The greatest of his sons is Mambrino King, that has added very much to the credit of the family in 1892. American Star 14 was for years the leading brood-mare sire and was considered the happy nick for a Hambletonian sire, and the list of successful sires out of daughters of American Star is a very long one and includes such sires as Dictator, Robert McGregor, Jay Gould and Masterlode.

During the year 1892, Almont and Blue Bull have both passed American Star in the number of performers produced by daughters, Almont at the close of 1891, had 36 daughters that had produced 46 in the list, and Blue Bull had 36 daughters that had produced 41 in the list, and at the present time they stand 60 to the credit of Almont and 55 to the credit of Blue Bull. Almont is credited with siring 36 in the list, and Blue Bull with something over 60. Sixty-four of the sons of Almont had 196 in the list at the close of 1891, and the sons of Blue Bull had advanced from 5 sires in 1887 to 26 in 1891, that had 41 in the list and 10 new ones have been added during the present year, and the sons of Blue Bull will be credited with over 60 at the close of the season of 1892.

Nutwood is by the records the greatest living sire, having 67 to his credit at the close of 1891, a much larger number than ever stood to the credit of any living animal, Electioneer possibly excepted. The probabilities are that Nutwood will live until his sons and daughters number more than 100, but it was not to this that I wished to call attention, but to the fact that more of his daughters appear as dams in the 1892 list than are represented by any other sire.

At the close of 1891 Electioneer was represented only by 59 descendants in the first generation, but the season just closing will advance him many points. At the same time Blue Bull, measured by the same standard, had but 81 in the first generation but has advanced to 116 during the season just closing. As Electioneer had opportunities enjoyed by few, if any, sires of his day, he led them all in the sons and daughters placed in the 2:30 list. So his sons and daughters will go on transmitting his greatness. The horse that sires speed with the greatest uniformity, be he plebian or royally bred, will transmit the power to breed on through both sons and daughters.

In the next year Hambletonian will give place to Blue Bull and Almont as a sire of producing dams, a larger per cent. each year will enter the great brood-mare list, daughters of these great sires, only to give place later to the daughters of Nutwood, Electioneer, Alcantara, Happy Medium and Egbert, as Hambletonian gave way as a sire to Blue Bull, and Blue Bull to George Wilkes, and George Wilkes in turn to Nutwood, Happy Medium and Electioneer.

This to me is plain, there is no prepotency in one direction which will not as surely develop in other ways. The horse that gets broodmares, will also transmit the same prepotency to his sons given

Digitized by Google

the same opportunities. Bayard, judged by the records, was a greater sire of speed than Pilot Jr.; already the sons and daughters of Bayard are attracting attention as sires and producers of speed.

Mr. S. T. H. may write all pacing families as deteriorating, but the fact remains that a daughter of Bayard holds the half-mile race record, and that Bayard has more in the list than had his sire, and that sons and daughters are now being sought for by progressive breeders. The American Trotter as a breed is forming, and pacing blood will call for no inconsiderable place in the make-up of this wonderful type of "Man's best friend."

JOB'S HORSE.

BY A. B.

A CHAPTER on the horse, compiled from the book that has had the largest circulation of any work ever published, ought to offer an enticing exercise for any lover of the animal named who might be of a "literary turn." Such a compilation from such a source ought to commend itself and be acceptable in any series dealing with horses of different nations.

Regarding the subject in hand we believe there is enough interest to sustain sufficient attention to carry the reader from start to finish without altogether flagging.

The written history of the horse deals entirely with the animal as under the control of man. In no case do we obtain a presentation of the species as naturally feral. Of course from this must, however, now be excepted the horse of Prejevalsky, if that continues to sustain its rank as a native species and is not at last proved to be simply the descendant of individuals escaped at an early period and crossed with some other migrant equine form. All the accounts of "wild horses" refer to the descendants of such escaped with the exception just named.

The earliest written records of the horse that we are best acquainted with occur in the literature of the Bible. Indeed this book contains one of the most magnificent descriptions of the horse extant, some considering it the most brilliant picture of equine nobility ever conjured up before the mind's eye. This picture is to be found, as every one knows, in the book of Job as contained in the Old Testament. The horse is taken as the symbol of might:

"Hast thou given the horse strength? Hast thou clothed his neck with thunder? Canst thou make him afraid as a grasshopper? The glory of his nostrils is terrible. He paweth in the valley, and rejoiceth in his strength; he goeth forth to meet the armed men. He mocketh at fear, and is not affrighted; neither turneth he his back at the sword. The quiver rattleth against him, the glittering spear and the shield. He swalloweth the ground with fierceness and rage; neither believeth he that it is the sound of the trumpet. He sayeth among the trumpets, *Ha! ha!* and he smelleth the battle afar off, the thunder of the captains and the shoutings." (Job xxxix, 19–25).

Such a description would naturally lead any one to believe that, among the people from one of which such a description could emanate, the horse would have long surely occupied a foremost place in affairs of society and state. But such, strangely, was not the fact. Indeed, the horse was an unknown "adjunct" to the wealth of the Jews. The "ox and the ass" were preferred. The noble animal was a national taboo among the chosen people.

As an interesting chapter in equine asssociations, we propose here to present the allusions which exhibit the peculiar status of the horse among this much-inquired-into people as they appear in the record of their national history.

We have no account of the existence of the horse in the days of "the grand old gardener." We may suppose he was similarly absent in the ark of Noah.

That eminently respectable firm consisting of the three great patriarchs, Abraham, Isaac and Jacob, we are informed, had among other domestic possessions "much asses," but no horses.

Digitized by Google

Abraham, on his departure with Sarai, his wife, and Lot, his brother's son, for Haran, passing into Canaan—which was promised, in a dream, to his seed—finding a famine in that land, came into Egypt. The King of this land beheld the fairness of Sarai, whom the man of wisdom had introduced as his sister, so that he might find favor through such relationship to one so fair in the sight of the Pharoah. The King, being smitten with the lady, "entreated Abraham well for her sake: he had sheep and oxen and he asses and she asses and camels" (Gen. xii, 16) of which he made a most goodly offering to Abraham. The patriarch also received presents from Abimelec, Prince of Girar, on the northern frontier of Arabia Petræa. In neither case was the horse enumerated.

When Abram got himself into the land of Mount Moriah to offer up his only son Isaac, "he rose up early in the morning and saddled his ass, and took two of his young men with him, and Isaac his son." (Gen. xxii., 3.) This happened fifty years later to the incident with Pharoah.

When Isaac was forty years old he married Rebekah. Twenty years later Esau and Jacob were born. Esau was forty years old when he married. After this Jacob went to Padan-aram, where he, after serving seven years for each, married Leah and Rachel. By these he had a large family. It was after the birth of Joseph that he departed to return to Isaac. There must have thus elapsed another period of thirty to forty years. So that when we get another glimpse of the traveling stock of these people, on Jacob's returning to Isaac, the former was so conscientiously afraid of meeting Esau that he sent as a present to his brother, "two hundred she goats and twenty he goats; two hundred ewes and twenty rams; thirty milch camels with their colts; forty kine and ten bulls; twenty she asses and ten foals." (Gen. xxxii., 10–15.)

At a later period, when Jacob sent his ten eldest sons into Egypt to buy corn during the famine, they "laided their asses with corn and departed." (Gen. xlii., 26.)

Previous to this, however, it is recorded that after Joseph had, satisfactorily to Pharoah, interpreted the king's dream, the latter advanced the former to be chief ruler, "and he made him to ride in the second chariot which he had." (Gen. xii., 43.)

Afterward, when Jacob set out for Egypt to meet his son Joseph it was "in the *wagons* which Pharoah had sent to carry him" (Gen. xliii., 5., xiv., 19–21). But to carry the presents Joseph sent to his father there were used twenty asses.

In the forty-seventh chapter of the same book (Genesis), we are told that Joseph gave the Egyptians "corn in exchange for *horses* besides other cattle" (17).

In the forty-ninth chapter, Isaac, in blessing his sons, says: "Dan shall be a serpent by the way, an adder in the path that biteth the horses heels so that his rider shall fall backward." On Jacob's death Joseph buried his father "and there went up with him both chariots and horsemen, and it was a very great company" (Gen. i., 9). Joseph himself died at the age of an hundred and ten years.

The first indication of the existence of horses we have, then, is the mention of "the second chariot" Pharoah had, of the horses given in exchange for bread, of "the *wagons* sent by Joseph to convey his father to Egypt, followed by the mention of the chariots at Jacob's funeral. We see the horses were Egyptian and must have been quite rare and only in use by the very greatest in the land.

The date of the incident first mentioned of Abraham has been placed by chronologers at about 1900 years before the birth of Christ.

The date of the first mention of horses in Egypt—brought to Joseph for exchange and used at Jacob's funeral, etc., has been similarly fixed as about 1700 years before the birth of Christ.

This is held to have been during the period of the reign of shepherd kings, or Hyksos, whose conquest and occupation of Egypt for 250 years held so prominent a place in the ancient history of that country. Champoleon identifies the Hyksos with the Scythians. Admitting such fact, we have this: that somewhere

Digitized by Google

between the periods mentioned (1900 and 1700 B. C.) horses were first introduced or appeared in Egypt, and came with the invading Hyksos, who were derived from Scythia or Tartary. Tartary is thus supposed to have been the originating point of the Egyptian horse.

The Egyptian monuments, prior to B. C. 1500 (the 18th dynasty, Rameses V.), the period of the Israelitish exodus, give no representation of horses. But this negative evidence should not disprove an anterior existence.

Though held in the greatest of esteem by the Egyptians on account of its prime utility, the horse was never a sacred animal, nor yet an emblem of any of their deities. This is somewhat significant, and might be advanced as an evidence of the recent introduction of an animal of which the older artists had not yet been inspired to model. Egypt is not a country naturally adapted for breeding horses, else they would have been common today. This further hints at the horses made known to us by the Pharoahs as being introduced—an introduction from whence, however, has been left a mystery entirely as far as Egyptian records have yet enlightened us.

The next we hear of the horses of Pharoah is in connection with the miraculous exodus of the children of Israel out of Egypt. Pharoah's army of chariots and charioteers in all their proud confident arrogance pursuing the long despised fugitive nation, must have been a splendid, imposing spectacle, followed by as awful a disaster and destruction in the Red sea as could be imagined.

"The Egyptians pursued after them, all the horses and chariots of Pharoah and his horsemen" (Ex. xiv., 9), and the God of Israel "will get honor upon Pharoah, and upon all his host, and upon his chariots, and upon his horsemen" (17), on account of their swallowing up between the walls of the sea, "For the horse of Pharoah went with his chariots and with his horsemen into the sea, and the Lord brought again the waters of the sea upon them" (Ex. xv., 19).

"And the Egyptians pursued and went in after them to the midst of the sea, even all Pharoah's horses, his chariots and his horsemen. And it came to pass in the morning that the Lord troubled the host of the Egyptians. And took off their chariot wheels, that they drave them heavily. And Moses according to the direction of the Lord stretched forth his hand over the waters that they came again upon the Egyptians, upon their chariots and the Lord overthrew the Egyptians in the midst of the sea, and the waters covered the chariots and the horsemen" (Ex. xiv, 23–28).

We may well imagine that the sweetest singers would be called on to celebrate in an ode the overthrow of the Egyptians. Miriam it was who invited her people to "Sing to the Lord for He hath triumphed gloriously; the horse and his rider hath He thrown into the sea" (21).

Here we have to take leave of the Egyptian, meantime. The next mention we have of the horse in historical records of the Jews, is during their wanderings, in "the desert" of Arabia. During this time there appears to be no allusion to the horse which became so famous in Arabia in other times. This would indicate that the animal was not in existence then. It was the object of Jehovah to keep the children entirely unacquainted with the horse. We are told that the word of God, through Moses His servant, commanded that when they should come into the land of promise and set a king over themselves, one of the main injunctions was that "he shall not multiply the horses to himself, nor cause the people to return to Egypt to the end that he should multiply horses, for asmuch as ye shall henceforth return no more that way." (Deut. xvii, 16.) In another place this was emphasized: "Woe unto them that go down to Egypt for help; and stay on horses and trust in chariots because they are many, and in horses because they are strong" (Isa. xxxi, 1).

These injunctions were made to impress the chosen children with the duty of reliance on the spiritual power that guided them. Further it was meant to prevent them from keeping up intercourse with a country for whose fleshpots they yet seemed to yearn. They were always a pastoral people and the land of promise was generally unsuitable for horse traffic.

Digitized by Google

Afterwards in the days of Solomon, we know how disgracefully the injunction was ignored.

We obtain some very vivid glimpses of the horse in the stories of the oppressions of the children in the early historical books, which we may bring together here.

There were no horses in Canaan in the time of the patriarchs. When the Israelites returned into Canaan the country lying between the Isthmus of Suez and the ridge of Lebanon, the horse had been naturalized therein.

For we find that when the confederacy of Canaanitish kings determined to annihilate the Israelites "they went out, they and all their hosts with them * * with horses and chariots, very many, even as the sand upon the seashore in multitude" (Josh. xi:4); enough to drive terror into any opposing army composed only of footmen. But "the Lord said unto Joshua, Be not afraid because of them, for to-morrow about this time will I deliver them up, all slain, before Israel; thou shalt hough their horses and burn their chariots of fire" (xi:6). "And Joshua did unto them as the Lord bade him: he houghed their horses and burnt their chariots with fire" (9). And Joshua possessed all their land.

The command to Joshua to hough the horses is supposed to have been given in consequence of the injunction not to multiply horses. Houghing meant to hamstring, that is, to cut the thigh sinew.

Michaelis has devoted special attention to this matter. He observes that many expositors, from ignorance of military affairs and of the veterinary art, supposed the command meant, not that the horses should be killed, but merely lamed in the hind legs and then let go. A horse thus severely injured would fall immediately to the rear, and writhe miserably about until he died. Hamstringing can be done in an instant and the animals operated on generally bleed to death. The wound never heals, so that even if the enemy recovered them alive they would have to ultimately destroy them. Michaelis adds that it would be inconsistent with the humanity of the law given to lame the horses without putting them to death. The permanent laming of a horse that would still live would have been extreme cruelty. Being wholly useless, no one would care for him or supply him with food.

We imagine the object of the houghing was simply to secure "siccar," immediate disabling of the animals whose use in war by their enemies filled the Jews with such terror. Other nations would have regarded the horses among the chief spoils.

The Romans found the same practice useful in disabling the elephants of their enemies, not being themselves able to manage such huge beasts when captured. The practice is also sometimes resorted to in disabling the bull in the Spanish bullfight, we believe.

At a later period "the Lord was with Judah and he drave out the inhabitants of the mountains; but he could not drive out the inhabitants of the valley, because they had chariots of iron" (Judges i, 19). But they triumphed miraculously. Some suppose these chariots of iron to have been armed with scythes or hooks —a terrible addition to their destructiveness when madly pressing against an enemy.

In the fourth chapter we are told that the children of Israel, again doing evil in the sight of the Lord, were "sold into the hand of Jabin, king of Canaan," whose captain was Sisera; and they cried unto the Lord, for Jabin had "900 chariots of iron" (iv, 3). And it was promised the children that "his chariots and multitude" would be delivered unto them (7). Sisera's "chariots, even 900 chariots of iron, all his chariots and all his host" were delivered into the hands of Israel, and Sisera fled on his feet and took refuge with Jael, a Kenite woman who treacherously slew him (xiii, 21). And "the mother of Sisera looked out at a window and cried through the lattice, Why is his chariot so long in coming? Why tarry the wheels of his chariot?" (v, 28.)

But the children were rejoicing and singing, "Thus were the horsehoofs broken by means of the prancings (or tramplings or plungings), the prancings of their mighty ones" (v, 22). And "Blessed above women shall Jael the wife of Heber, the Kenite, be," for her share in slaying the dreaded Sisera.

During the rule of Ahab, king of Israel, Ben-hadad, king of Syria, with thirty and two kings with him, and horses and chariots besieged Samaria (1 Kings xx, 1). And Ahab went out and smote the horses and chariots (21). But "the servants of the king of Syria said unto him, Their gods are the gods of the hills therefore they were stronger than we; but let us fight against them in the plains, and surely shall we be stronger than they (23), and captains were put in the place of the kings, and a new army was mustered like the army he had lost," "horse for horse and chariot for chariot." But when "the battle was joined" the Israelites again miraculously routed their enemy.

The next oppression of the Syrians was in the reign of Jehoahaz, king of Juda, who did evil in the sight of the Lord, and the king of Syria Ben-hadad again oppressed them. "Neither did he leave of the people to Jehoahaz but fifty horsemen and ten chariots, and 10,000 footmen, for the king of Syria had destroyed them, and had made them like the dust by threshing (2 Kings, xiii, 7). It would seem from this that the Israelites under Jehoahaz had used horses and chariots in battle.

Again we get another glimpse of the horses of the Assyrians. Sennacherib, their king vaunts his strength, and said, with the multitude of his chariots, he was come up to the heights of Lebanon. But he was checked by putting "a bridle in his lips" (2 Kings, xix, 23, 28). The manner in which "the Assyrians came down, like a wolf on the fold," had made these foes particularly feared.

Josiah succeeded to the kingdom to find idolatry again rampant. Being a good-minded prince he put down idolatry and witchcraft. "He took away the horses that the kings of Judah had given to the sun at the entering in of the house of the Lord, and burned the chariots of the sun with fire" (2 Kings, xxiii, 11).

We shall now deal with the palmy days of the chosen race—the period of Israel's greatest kings—Saul, David and Solomon. When Saul was called, by Samuel, the prophet, as ruler over Israel, he was seeking his father's asses (1 Samuel, ix, 3). In Saul's stables, when king, were 2,000 asses and 5,000 camels, but no horses. (B. C. 1090.)

David was the first Jewish king to establish a force of chariots. Yet he did not exactly countenance the multiplying unto himself of their numbers. He took them in war. He followed the plan of Joshua in houghing, but he retained a select number. In an expedition against the Philistines "David took from him (Hadadezar) a thousand chariots and seven hundred horsemen, and twenty thousand footmen, and David houghed all the chariot horses, but reserved of them for an hundred chariots" (2 Samuel, viii, 4). (B. C. 1040.)

This is "the first notice of the use by the Jews themselves of horses." Joshua carried out the command as to houghing, and the injunction of Moses as to not multiplying horses. David disregarded both to extent of retaining and using a select number of the horses seized in warfare.

When we come to Solomon, the most brilliant of all the kings of the Jews, we find he was by no means fastidious in regard to the laws of the prophets. He not only multiplied horses unto himself, but, what was rather worse, wives also. He was the most magnificent of all the long line of law breakers we have record of in sacred history. He was besides an adept horse-coper—disposing, to the Syrian and Phœnician kings that could not obtain them without their passing through Palestine, horses he purchased or received in tribute in Egypt or from other countries.

"Solomon had 40,000 stalls of horses for his chariots, and 12,000 horsemen," (1 Kings iv, 26), "And Solomon gathered chariots and horsemen; and he had 1,000 and 400 chariots, and 12,000 horsemen, which he placed in the chariot cities, and with the kings of Jerusalem," (2 Chron. 14). In another passage the number is placed at a "'thousand" instead of "four" or "forty thousand."

We are elsewhere told that "they brought unto Solomon horses out of Egypt and all lands" (2 Chron. ix, 28). "And they brought every man harness and spices, horses and mules a rate year by year (24). "And they fetched up and

Digitized by Google

brought forth out of Egypt a chariot for 600 shekels of silver, and an horse for an 150; and so brought they horses for all the kings of the Hittitis, for the kings of Syria by their means" (2 Chron. 1, 17; 1 Kings). (B. C. 1015).

The shekel varied from about 55 to 60 cents our currency. The sum given for chariots is four times that given for horses, "which gives some probability to the opinion, that, in this, as in other instances, the word *mercubah*, rendered chariot, denotes the horse belonging to a chariot; and, consequently, as it was then customary to yoke four horses to a chariot, the price of a set of chariot horses quadrupled that of a single horse. The Septuagint, however, understands a chariot to have been intended, and, upon the whole, it is most likely." Michaelis says the fixing of a price had the look of a monopoly, and indicates, besides, that horsemanship was in its infancy; for whenever people have sufficient knowledge of horses, with all their combinations of fault and excellencies, to judge of them as amateurs, one may be worth ten times as much as another, particularly in a king's stable.

There have not been wanting commentators that have endeavored to prove that Solomon not only traded in horses but profited by the supineness of the Egyptians, and their objection to the risk of exportation by maritime commerce, combined with the facilities of his own dominions to secure a monopoly, while he increased the safety of his own territories by an effective body of horsemen.

We have a hint of the dietary of the horse in Palestine at this time: "Barley also and straw for the horses and dromedaries" (Kings iv, 28). There is reason to believe that hay had not yet been invented—if indeed it was discovered in the East. It seems to be an entirely Western invention of later date. The last word, *dromedaries*, is rendered also *mules* or *swift beasts* and Tristram says it really means young horses.

The Hebrew word *recesh* (used in I. Kings, iv, 28; Esth. viii, 10–14). "bind the chariot to the swift beast" (Mic. i, 13); "the multitude of camels shall cover thee, the dromedaries of Midian and Ephat" (Isa. ix, 6), really means a swift or high-bred horse—a swift horse of peculiar and noble breed, particularly a stallion. The word is derived from a verb meaning to gallop. *Benirammac* (Esth. viii, 10) is translated "young dromedaries." It only occurs in this passage; but it is the same word as the Arabian *rammah*—"a mare." The translation should therefore be "sons of mares—young horses." *Parash* is likewise translated "horsemen" in the passages quoted. It should be rendered "horses." The word for chariot is *soos*. [Canon Tristram, "Natural History of the Bible."] The fact that we have thus words for "high-bred horse," and also "sons of mares," words used by the Arabs, is valuable, and may modify some of the statements as to the first appearance of the Arab horse. For instance, it is commonly said that in the days of Solomon, about 1000 B. C., Arabia apparently had not yet become a horse country, as we are told that this king, while importing gold and spices, etc., from Arabia, it was from Egypt that he procured his horses for himself and the kings of Phœnicia. The splendid sculptures discovered in the ruins of Nineveh have been shown to have been executed contemporaneously with the kings of Assyria who figure in sacred history. There is in these imperishable pictures nothing resembling or suggesting the Arab. One feature is conspicuous about the horses so represented, however; this is the high action of the knees—they almost touch the nose. This shows the high value placed on good knee action, and that it was favored. Hackney action is thus no new fad. These sculptures exhibit with vividness pictures of war and the chase; mules and asses are represented as beasts of burden and draught.

During the long period of their captivity in Egypt the Israelites did not acquire the art of horsemanship. They retained this indifference to the art, it may be said, throughout their entire history; for, though they partially used the horse in after times, it was never generally. Contrasting with the injunctions prohibiting their acquaintance with horses, we have the prophecy: "Then shall there enter into this city kings and

Digitized by Google

princes, sitting upon the throne of David, riding in chariots and on horses" (Jer. xvii, 25). But Christ entered Jerusalem on the back of an ass—a white ass of the highest breeding, such as the highest in the land would use.

The horse was to become the emblem of peace, not war. Bells were to be on the horses; those on the sculptures of Nineveh also "bore the bell." These bells were to exhibit a motto of holiness, we are told in the scripture.

The chariots were low hung, circular in shape of body, on strong wheels, with no springs. To ease the rough jar of the "jumpings" the floor was constructed of a network of leather loops. The two wheels had six spokes, a bow-case and spear-case occupied either side in front. Two horses or four were yoked to the chariot, generally simply harnessed, though the chariot had often rich trappings. Sometimes, especially in later times, the owner drove his own chariot into battle. The chariot was little used except in war, though it began to be used on state occasions, and thus came into more general use.

The "iron chariots" are by some regarded to have been armed with the deadly scythe we hear of in the "more barbarous" nations of later times. In II. Maccabees xiii, 2, we are told of "chariots armed with iron hooks." The horse and chariot became special adjuncts of war, and is thus literally and metaphorically mentioned. It was specially dreaded by the infantry; for, though the driver might have been disabled it continued in its headlong course of destruction through the ranks of the enemy. To ride in a chariot was reserved for occasions and people of the highest importance. Pharoah "made Joseph to ride in the *second* chariot which she had." This shows how few horse must have been in Egypt during the reign of the early shepherd kings. The chariots of Ahab Jehoram and Jehu are repeatedly mentioned. The eunuch of Candace, queen of Ethiopia, that came to Jerusalem to worship, was sitting in his chariot reading Esaisas the prophet (Acts viii, 28).

Jehu was a very Ben Hur. We are told (2 Kings, ix, 20) that "the driving is like the driving of Jehu, son of Nimshi, for he driveth furiously." Jehu is now a common name for a furious driver, and is often invoked furiously. Hence is the origin of the use of the name we apply so familiarly,

The generally rocky and uneven character of Palestine rendered horse multiplying impossible. The defense of the country was more efficiently promoted by infantry than by horse chariots. The Jews generally on the south were poor horsemen. But on the north, where they were more associated with horse peoples, they learned the art of horsemanship where the Asiatic horse was the model. The original horse of southwest Asia came from the northeast.

The people were, however, long acquainted with, though non-users of, the horse. They were a pastoral people, counting their wealth in herds and flocks, asses and camels, and not in the swift beasts. They were to be a peaceful people, and not to be encouraged in offensive warfare. The land that they were to possess was mostly hilly. "Their gods were the gods of the hills." Southern Judah, the eastern domains of Reuben and Gad and Manasseh, were not adapted to tillage. Western Palestine is too hilly for horse husbandry, even now. It was only in the maritime provinces, the plains of Esdraelon, and the northeast frontier, that chariots of war could be advantageously used. Here the Canaanites had many horses and chariots, the Israelites none. The hills were peaceful and secure, the plains inviting and open. The latter favored horse tactics; the former did not.

In the war between Joshua and the confederate kings of Syria, carried on in the long, level plain of Upper Jordan, a new feature presented itself to the Israelitish general. The horses and chariots were something he had not reckoned on. In the hills of Napthali, on the other hand, speed was useless; the horse and chariot, a detriment; there they were an easy prey. A hundred and fifty years after this the battle was once more waged in the plains by another Jabin, where in after years Ahab and Jehu drove their vehicles. The defeat again of the chariots was terrible. They were driven into

Digitized by Google

and engulfed in the swamps and mud of the swollen Kishon (Judges iv,) "the river Kishon swept them away, that ancient river Kishon. Then were the horse hoofs broken by means of the prancings, the prancings of their mighty ones." (Judges v, 21–22.)

Israel was an army of infantry (1 Kings, xx, 23). A direct allusion to the absence of cavalry as a cause for more explicit trust in Jehovah is frequent in the pages of the Old Testament. The horses and chariots of their enemies were the most formidable weapon they had to contend with. The horse was entirely associated in their minds with war. There is, however, one instance in which this was not the case (Isa xxviii, 28): "Bread corn is bruised; because he will not even be threshing it, nor break it with the wheel of his cart nor bruise it with his horsemen." There the horses were not yoked like oxen at the same work, but were loose and made to run round about on the floor at will.

David's select number of a hundred chariots were kept for the purpose of continuing in subjection the champaign country.

Solomon, if not a breeder, was a large importer of horses. He it was who probably created the main chariot roads between Jerusalem and the north, and across Esdraelon to Gilead. His successors had all horses and chariots and used these roads — Jehosephat and Ahab, Rehoboam, Ahaziah, Joash and Josiah. The rulers of the northern kingdoms possessed a country better fitted for horsemanship, and the chariots of the kings are repeatedly under review.

After the destruction of the chariots of Jehoahan, son of Jehu, by the Syrians (2 Kings, xiii, 17), the Israelitish power seemed to wane. Judah's force of chariots was insignificent and ridiculed. Hence in future the kings relied on Egypt for replenishment of their horses, and they went down there for the same in spite of the warnings they had received.

The horse is conspicuous for its absence among the animals mentioned in the decalogue given to Moses. In the tenth commandment "they were not to covet the ox or the ass of their neighbors." This would seem to prove that their neighbors were not yet in possession of horses, which would have been much more desirable than asses. Or, as Burdette hints in a poem, alluding to the fourth commandment:

"Now parson's readin' the Scripture: 'Remember the Sabbath day;
In it thou shalt not do any work'—'Amen,' the people say,—
'Thou, nor thy son, thy daughter, thy cattle, thy ox, or thy ass.'
Don't seem to exempt the horses, eh? So we'll let the letter pass."

Reference was made to the ass in order to denounce its flesh as unclean. But on account of its peculiarly strong-footedness it was much more adaptable to the country generally than horses.

The quality of the hoof is referred to several times: "Arise and thresh. I shall make thy hoofs brass, and thou shalt beat in pieces many people" (Mic. iv, 13). In the execution of God's judgments: "Their horse's hoofs shall be counted as flint" (Isa. v, 28). We have also seen the contempt in which the enemy's horses were held, when, in battle, their hoofs were broken by the prancings of the mighty ones. When the hoofs were counted as flint it was the highest praise it was possible to bestow.

In the book of Esther we find mention of "the horse that the king rideth on" (vi, 8). Mordecai, the high priest, was arrayed and brought on horseback. Letters were written, through the influence of the sweet Esther, by Mordecai, in the name of King Ahasuerus, to allow the Jews throughout the land to gather together. The letters were sent "by posts on horseback, and riders on mules, camels and young dromedaries" — swift horses—(viii, 10). "So the posts that rode upon mules and camels went out" (14).

As elsewhere in the history of the use of the horse by men, the same order followeth in the records of the Jews. The first we see of the horse is as being *driven*, and the last as being *ridden*.

We are told that the horse was a vehicle of the commerce of Tyrus: "Dedan was thy merchant in precious clothes for chariots" (Ezek. xxvii, 20). "They of the house of Togarmah traded in thy fairs with horses" (xxvii, 14). In Rev-

Digitized by Google

elations we are told that "Babylon is fallen, and the merchants of the earth shall weep and mourn for her, for no man buyeth their merchandise any more." Among the many articles of commerce mentioned are horses and chariots (ch. xviii).

The horse and the chariot are used to fill in many a picture of bold imagery: "At the noise of the stamping of the hoofs of his strong horses, at the rushing of his chariots, and at the rumbling of his wheels" (Jer. xl, viii). "Harness the horses, and get up, ye horsemen; and stand forth with your helmets, furbish the spears, and put on the brigandines.... Let not the swift flee away. ....Come up, ye horses, and rage, ye chariots, and let the mighty men come forth.... For this is the day of the Lord, a day of vengeance, that he may avenge him of his adversaries" (Jer. xlvi, 4, 6, 9, 10). Then we see the horse and chariot and horseman in battle: "The noise of a whip, and the noise of the rattling of the wheels, and of the prancing horses, and of the jumping chariots. The horseman lifteth up the bright sword and the glittering spear" (Nah. iii, 2, 3).

Speaking of the Chaldean, Habbakkuk says: "Their horses also are swifter than the leopards and are more fierce than the evening wolves, and their horsemen shall spread themselves and their horsemen shall come from afar; they shall fly as the eagle that hasteth to eat" (Hab. i, 8). 'Behold, a people cometh from the north country, and they ride upon horses, set in array as men in war against thee, O daughter of Zion" (Jer. vi, 23; l, 42). 'I will bring upon Tyrus, Nebuchadnezzar, king of Babylon, a king of kings, from the north, with horses, and with chariots, and with horsemen and companions" (Ezek. xxvi, 7). "By reason of the abundance of his horses their dust shall cover thee; thy walls shall shake at the noise of the horsemen, and of the wheels and of the chariots, when he shall enter into thy gates. With the hoofs of his horses he shall tread down all thy streets" (10).

The people had to bear the consequence of showing contempt for God's word, thinking they could escape his wrath: "Ye said No; for we will flee upon horses, therefore shall they that pursue you be swift" (Isa. xxx, 16). Again: "Every one turned to his own course as the horse rusheth into battle." (Jer. viii, 6.) The psalmist shows the people that the mighty, in their thought, can not be served by such strength: "An horse is a vain thing for safety, neither shall he deliver any by his great strength" (Psa. xxxiii, 17). "He burneth the chariot in fire" (xivi, 9). "At the rebuke both the chariot and horse are sent into a deep sleep" (l xxvi, 6). Joel describes the unbelievers in God's judgments: "The appearance of them is as the appearance of horses, and as horsemen so shall they run" (ii, 4).

Zechariah describes how the Lord of hosts through Judah, had made his people "like his goodly horse in battle," to confound his enemies; "and the riders on horses shall be confounded" (x, 3, 5). In the same book it is prophesied that, "In that day shall there be upon the bells of the horses, *Holiness unto the Lord*" (xiv, 20)—a symbol of peace: as the white horse in Revelation was of victory.

It seems a remarkable fact that though the horse was practically unknown to the Israelites—i. e. in the sense we find them knowing the ass, etc., yet evidently the animal was admired especially by the poets and seers as a figure of might, grandeur and mystery. The psalmist sings: "The chariots of God are twenty thousand" (Psa. l xviii, 17). "Who maketh the clouds his chariots" (civ, 3). Habakkuk exclaims: "Was the Lord displeased that thou didst ride upon thine horses and thy chariots of salvation" (Hab. iii, 8).

Isaiah in his vision of the fall of Babylon "saw a chariot with a couple of horsemen, a chariot of asses, and a chariot of camels" (xxi, 7). "And behold here cometh a chariot of men and a couple of horsemen" (9).

In the translation of Elijah, who was a contemporary of Homer, there appears a chariot of fire, and parted them both asunder; and Elijah went up by a whirlwind into heaven. And Elisha saw it, and he cried, My Father, the chariot of Israel and the horsemen thereof. And he saw him no more" (2 Kings ii, 11). Elisha had a further experience: "Therefore sent he [the king of Syria] thither

Digitized by Google

horses and chariots a great host, and they came by night and compassed the city [Dothan] about with horses and chariots. And Elisha's servant cried, Alas, my master, what shall we do? And Elisha prayed that the eyes of the young man might be opened that he might see. And he saw the mountain was full of horses and chariots of fire round about Elisha" (2 Kings vi, 14-17).

Zechariah also saw many visions in which horses figured conspicuously: "I saw by night, and behold a man riding upon a red horse, and behind him were three red horses speckled and white. Those are they whom the Lord hath sent to walk to and fro through the earth" (Zech. i, 8 10). In the vision of the four chariots the same seer says, "I turned and lifted up mine eys, and behold there came four chariots. In the first chariot were red horses; and in the second chariot were black horses; and in the third chariot were white horses, and in the fourth chariot were grisled and bay horses. * * * Those are the four spirits of the heavens, which go forth from standing before the Lord of all the earth. The black horses which are therein go forth into the north country; and the white horses go forth after them; and the grisled go forth toward the south country. And the bay went forth, and sought to go that they might walk to and fro through the earth; and he said, get you hence, walk to and fro through the earth. So they walked to and fro through the earth. * * * Those that go toward the north country have quieted my spirit in the north country" (Zech. vi, 1–8).

In Revelation the horse figures grandly in the vision introduced by the familiar "And I, John, saw." These revelations are expressed in such excellent language that they may, for completeness, be included herein.

"And I saw, and behold a white horse, and he that sat on him had a bow and a crown was given unto him, and he went forth conquering and to conquer. And there went out another horse that was red and power was given to him that sat thereon to take peace from the earth and that they should kill one another; and there was given unto him a great sword. And I beheld, and lo, a black horse; and he that sat on him had a pair of balances in his hand. And I looked, and beheld a pale horse and his name that sat on him was death and hell followed with him" (Rev. vi, 2–8).

"And the shapes of the locusts [that came out of the bottomless pit] were like horses prepared unto battle, and on their heads crowns like gold and their faces were as the faces of men (Rev. ix, 7), hair like women, teeth like lions, breastplates of iron; the sound of their wings was as the sound of chariots of many horses running to battle. They had tails like scorpions and stings in their tails. Their power was to hurt men five months. They had a king over them—the angel of the bottomless pit whose name in the Hebrew tongue is Abaddon, but in the Greek tongue Apollyon" (8–11).

"And the number of the army of the horsemen were two hundred thousand thousand; and I heard the number of them; and thus I saw the horses in the vision and them that sat on them having breastplates of fire, and of jacinth and brimstone; and the heads of the horses were as the heads of lions; and out of their mouths issued fire and smoke and brimstone (16, 17).

"And I saw an angel standing in the sun, and he cried with a loud voice to all the fowls of the air to come and gather into the supper of the great God. That they might eat the flesh of kings—and the flesh of horses and of them that sit on them" (Rev. xix, 17, 18).

The mystery of these visions has not been revealed, explained to us. We can understand them as illy as we can the myths of the sacred hymns of the Vedas and of the mythologies in which the horse figures so prominently.

We trust that in this chapter of equine history we have not intruded too greatly on the patience of the reader. We believe there are allusions herein made that are interesting to be presented collectedly. There will also be found, we think, references which may prove of further interest and may be picked up again in dealing with the domestic history of horses of other nationalities. This justifies the attention we have been allowed to bestow on this phase of horseology.

THE STORY OF PRINCESS.

In the year 1855 Chicago was a city of only about 35,000 inhabitants, but even then it could boast of three race tracks and many good trotting horses, such as the black gelding Reindeer, 2:28; Ike Cook, 2:27; Prairie Boy, Black Ralph, Lady Kate, Lady Jane, Selim and many other good ones that were used as track horses. And the good road horses that were in the windy city were as thick as fleas in Florida.

During the spring of 1855, David A. Gage, proprietor of the Tremont House, Chicago, purchased a bay mare in New Hampshire and took her to Chicago and used her as a road horse. This mare was called Topsey and showed considerable speed. At that time I was connected with the Michigan Central Railroad, and running as conductor from Chicago to Detroit. My brother was proprietor of the Briggs House and had a chestnut gelding called Sorrel Charley, that was quite speedy for a roadster.

The Tremont House and the Briggs House were rivals in the horse business as well as in catering to the wants of the human family. During the winter of 1855 we used to drive our horses for speed on the ice on the Chicago river, and it made a grand drive usually from November to March.

In December, 1855, a race was made for a wine supper for ten, between the bay mare Topsy and the Briggs House gelding Charlie, to be trotted on the ice over the river. The supper was to be served at the losing hotel. The race was trotted to skeleton sleighs. Topsy was driven by an old driver, Otis Dimmock, and Sorrel Charlie by the writer. Suffice it to say that the supper was served at the Briggs House, Topsy winning the race easily. This was Topsy's first race. The horses were matched that night to trot the coming May over the Garden City track for $500, mile heats. Topsy was handled by George Bidwell and Charlie by Robert Champlin, both old and experienced drivers in those days. But when the day came for the race to be trotted we found that we could just save $250 by paying forfeit, as it had leaked out that Topsy was a slick piece of furniture and would cook our mutton if we started against her in the race. So our party paid forfeit. A large crowd had gathered to see the race and to give them a show for their gate money; another race was made between Topsy and the chestnut gelding Selim for $200.

The race was to wagons, three in five-mile heats. Selim was the favorite, two to one; he was a good steady horse, while Topsy proved to be a very poor breaker. They had given Topsy a trial a few days before the race, and she had showed them a mile in 2:43 to harness.

Selim was rated at about 2:40. In the first heat Topsy trotted well up to Selim until they reached the half-mile pole when she made one of her standstill breaks, and Selim came within an ace of showing her the flag, in 2:43½. Of course it was then dollars to doughnuts that Selim would win the race. But sure things sometimes fail. The second heat Topsy got her right foot forward and, to the astonishment of everyone (her driver and owner as well) just distanced Selim in 2:35. This was was good time in those days, and Topsy's stock went up.

Topsy was sold that night to Mr. Andy Daniels, of Chicago, and she was taken to St. Louis and trotted a number of races against local horses there. From St. Louis she was taken to New Orleans and we lost sight of her.

Flora Temple was acknowledged queen of trotters from the time she beat Tacony, "or distanced him," over the Union track in 2:24½. This was September, 1856. From that time until 1859 she had few engagements, although she was hippodromed with the black gelding, Lancet, and other horses, and did trot a match race against Ethan Allen to wagon, Ethan making Flora trot in 2:25 to beat him.

In the spring of 1859 Jim Eoff arrived in New York from California with a bay mare, and offered to match said mare against any horse, mare or gelding, mile heats, three in five, two-mile heats, and three-mile heats, to harness or wagon, for $5,000 each race. Jim Eoff or "Dismal Jimmie," as he was called, was an able trainer and driver, and was considered a first-class match maker. He was as cunning as a fox, and a great

Digitized by Google

master of humbug. Eoff got up such a "mystery" and speculation in regard to the bay mare that he had brought from California, that the owners of Flora Temple were afraid to match her. But an arrangement was entered into that they should trot three-mile heats to wagon on the Eclipse course and divide the gate money. It was given out that they were matched for $2,500 a side, but the truth is that nothing was at stake between them. Now, that was just the kind of race that Eoff was hunting for and a kind of race that he liked to handle. Jim Eoff was a very unscrupulous man. After the arrangements had been made for the races, Eoff gave the name of his bay mare as Princess, and it proved to be the same mare, Topsy, that had trotted in Chicago in 1855.

Eoff took the mare to California in the spring of 1856, and developed her there. While in California she had trotted a number of races. She trotted two races of ten miles, against Glencoe Chief, and won both races in 29 minutes, 10¾ seconds, and 29 minutes, 16 seconds. The first of these races was for the large amount of $36,500, and the second race for $10,000. Her best mile in public had been 2:30, but she trotted a mile to wagon in a trial with a pacer and beat 2:20, which induced the party to bring her eastward again. The writer was well acquainted with Jim Eoff, and got the facts of the mare's career while in California from him. Eoff told me a short time before he died in San Francisco, Cal., that he drove Princess better than 2:20 in her trials before she was shipped from California to the eastern states.

Flora and Princess trotted the first race of three-mile heats over the Eclipse course, June 16, 1859, in the presence of a great crowd. Eoff had so worked upon the belief of many credulous people that they actually laid bets on seven minutes and thirty seconds being made to wagons in the race, which would have beaten old Dutchman's time of 7:32½ to saddle. Dry Talman drove Flora and Eoff drove Princess. Before they started there came up a heavy rain storm and the track was very slippery and bad. Princess led for nearly a mile, but Flora got to her head and they crossed the score head and head in the first mile in 2:37. The second mile was made in 2:40½, the mares on equal terms. Princess led three lengths to the half-mile pole when Flora made a rush and was at Princess' head at the three-quarter pole. Flora then took the lead and won in 7:54.

It was whispered about that Eoff would not let Princess win. He very likely instigated the report himself, for it was part of his tactics to make people believe that Princess could beat Flora whenever he thought best to do so. There is not much doubt but that Eoff had his money invested on the other side of the house.

In the second heat Flora took the lead. The first mile was in 2:37½, and the second in 2:36½. In the third mile Flora pulled a shoe off half way up the stretch and broke and many believed that Eoff might then have passed her and won the heat if he wanted to do so, Flora was on a hobble all the way home, but Princess never got to her head and the little mare won in 7:59½. About nineteen out of every twenty people believed that Eoff pulled Princess in the last heat on purpose to lose it. But Dismal Jimmie pulled the wool over their eyes and got away with the baggage. He was as slick as grease.

In a week after the three-mile race to wagons, Flora and Princess trotted two-mile heats to harness. The betting opened 100 to 70 on Flora but before they started it was even. Tallman drove Flora again in that race. Flora seemed rank and wild, while Princess, on the other hand, was quite steady. They went away at a great rate. Princess led Flora to the score in the first mile in 2:26, but Flora was at her saddle.

Flora broke on the first turn, but when she caught she made a resolute dart to close with Princess and got to her head, but made another break, and Princess won the heat in 5:02, and no doubt could have trotted it much faster had she been pressed in the second mile. It was ten to one on Princess after the first heat. She took the lead and kept it all the way and won handily in 5:05. On the 6th of August, these two famous mares again

Digitized by Google

appeared to dispute for victory on the same course, mile heats, three in five, to harness. Princess was the favorite, 100 to 80. The crowd was great. Flora was driven in this race by James McMann. Flora was in good fix for the race, full of life and spirits. At the word she darted to the front and outfooted the Princess to the quarter in thirty-five seconds and led Princess thirty yards, but at the half-mile pole in 1:10½ Princess was at Flora's wheel, so she must have trotted that quarter very fast. The mares hung together from the half-mile pole home, Flora winning the heat by a short length in 2:23½. Many believed that Eoff could have won the heat if he liked. Princess had shown such a wonderful flight of speed in the second quarter and had closed such a gap so quickly that it was evident she could out-speed Flora at any part of the game.

Flora was half a length behind when the word was given in the second heat, but she collared Princess half way to the turn, and Princess broke and lost five or six lengths. Flora was at the quarter pole in thirty-four seconds, at the half in 1:09 six or seven lengths ahead, but Princess closed the gap and was at Flora's wheel at the score in 2:22.

In the third heat Flora took the lead and went to the quarter in thirty-five seconds three lengths ahead. At the half in 1:10 Flora led five lengths, but Princess closed the gap and was head and head at the head of the stretch. It looked critical. Down the stretch they came, head and head, but Flora seemed to out-stay Princess and won the heat and race in 2:23½. There had never been anything like such a race before.

Flora Temple and Princess met again at the Eclipse course on the 16th of August to trot two-mile heats to harness. In spite of Flora's grand performance on the 9th many still believed that the California mare was able to beat her, especially at two-mile heats. This feeling was so general (with Dismal Jimmie's help) that Princess was the favorite at $100 to $80. Both the mares were in fine fix and fast time was expected, and they were not disappointed, as before they went home they saw the fastest two-mile heat that ever was trotted. In the first heat Princess had the best of the start and went away at a tremendous gait for a two-mile heat. Flora gained inch by inch, and at the quarter in thirty-five seconds, Princess had but a neck the best of it. At the half-mile in 1:11¼, Princess led by a short neck. Soon after passing the pole they were head and head. As they swung into the stretch Flora had a head the best of it. They crossed the score in the first mile head and head in 2:23. Flora led at the first quarter in the second mile by a head and thus they went to the half, when Princess closed with her. At the three-quarter pole Flora led a short length, and from there to the score Flora led by a length. The rate of speed seemed to make Princess a little dizzy. Flora won in 4:50½ without a skip or break, and both mares trotted some of the heat at a 2:20 clip. The second heat the mares went head and head. The first mile it was a neck-and-neck struggle in 2:24. In the first turn in the second mile Princess made one of her Jim Crow breaks and threw up the sponge. Flora jogged out in 5:05.

These mares, while only trotting for gate money, had showed the two fastest trots and better contested than had then been witnessed, and let the reader remember that these trots occurred thirty-three years ago. The sulkies that the mares pulled weighed seventy-five pounds, and Jim McMann, that drove Flora Temple, was some twenty pounds over weight.

After the above race Dismal Jimmie and Uncle Jim McMann did not let the grass grow under their feet. They were not that kind of people. The mares both had a world-wide reputation, and Eoff kept stuffing it down the throats of the people that Princess could and would beat Flora in the next race. They hippodromed the mares all over the country until they got to Kalamazoo, Mich., when in a race at that place October 15, 1859, Flora Temple, Princess and the chestnut gelding, Honest Anse, started in a race, mile heats three in five, for a purse of $2,000. The first heat was won by Flora in 2:24. Honest Anse chased her to the three-quarter pole a very fast clip, and then he shut up like a jack

Digitized by Google

knife. Princess was second. The second heat Flora won in 2:22½ and Honest Anse was then withdrawn. Flora and Princess started in the third heat. They went to the half mile in 1:09. Flora then cut loose and passed the score in 2:19¾, and that was a day long to be remembered. It was the writer's good fortune to witness the race, and a race that I never shall forget. The question of superiority between these beautiful and capital mares had now been fairly tested in the minds of many people, although hundreds were of the opinion that the California mare could have beaten Flora in some of their races, especially in the two-mile heat races.

The last race that Princess trotted was on May 21, 1861, and her opponent was Flora Temple. It was over the Fashion Course, Long Island. Princess went wrong a short time before the race and Flora won in slow time. Princess was then retired from the turf, and as is well known was bred to Hambletonian 10, and produced Happy Medium, and he is the sire of Nancy Hanks, whose dam is Nancy Lee. Any person who ever saw the mare Princess, can see at a glance that Nancy Hanks has to a great extent the formation of the old mare, and is gaited just like her. Princess had a low, stealing gait and trotted with her head straight out. She was rather a light-waisted mare and did not look like a mare that could stand up and trot the distance that she did. She was very nervous and vicious in the stable. As stated above many people were of the opinion that Princess could have beaten Flora in a number of their races if Eoff had wished to do so. In fact, it was proven beyond a doubt that Eoff won a large amount of money in the first and third race that they trotted. The flights of speed that Princess showed in the races were remarkable. She could outspeed Flora in any spot or place when Eoff would give her her head and in her long races in California she had proved herself a stayer from the old house.

So strong was the feeling against Eoff after the race of three-mile heats, June 16, that, if he could have been found five minutes after the race, his life would not have been worth much. Jim just skipped out of the track and his form was invisible for a day or two. Flora Temple was sold to William McDonald, of Baltimore, Md., during the above races, and after the races had been trotted, as stated above, they hippodromed over the country. It was a tacit understanding with Eoff that Flora should win every race, although the gate money was divided. McDonald was a very wealthy man and would not have Flora beaten for ten times the amount of the winnings, and he made no bones of proclaiming it to his friends during the campaign. And all Dismal Jimmie wanted was his share of the "chicken pie."

In the races that Princess trotted with Flora during the campaign, she seemed to get sour and discouraged. She was naturally an ambitious and nervy mare, but we think that by being pulled behind so much, when she could have won, she got sour and lost her courage. And many good judges were of the same opinion. We have seen other horses in the same boat. Now, let the reader judge for himself where Nancy Hanks gets her speed and staying qualities from to a great extent. We give Nancy Lee's side of the house due credit for its share of the glory. As is well known, Nancy Hanks is an inbred Hambletonian. We see that "as usual," your contemporary from the Boston baked bean, brown bread and codfish-ball town, called the "Hub," contends that Nancy Hanks is indebted to a great extent to the thoroughbred for her speed, and as I stated in an article on old Lady Franklin, some months back, he seems to think that every trotter of any account is indebted to old Diomed for his "get there" qualities of speed and endurance. But as he has got old Diomed on the brain, and is entitled to his opinion, we will let him rip and say nothing, but keep sawing wood.

I believe that Princess was the property of Mr. David A. Gage at the time of her death. She was bred by Mr. Calloway, of Orange county, N. Y., and I think sold to Mr. Steele, of Philadelphia, and after her usefulness was gone, Mr. Gage bought her to be sure that want and suffering should not overtake her in her old age.—*George P. Floyd, in the American Trotter.*

Bad Points in Horses.

RULES are given for the guidance of those who select horses for the use of the cavalry in the army in Great Britain, and quite a number of these are applicable in choosing a horse for any kind of work. They are as follows:

1. Size.—Four-year-olds—*i. e.*, three off after October — should not be less than 15.0½ hands, nor exceed 15.1½ for light cavalry.

For medium they should not be less than 15.1 nor over 15.2.

For heavy cavalry not less than 15.2 nor over 15.3½.

N. B.—In measuring a horse or judging of his height and size by sight take care that he stands on a level with yourself. Dealers generally stand a horse, if undersized, on higher ground, or if over size on lower ground than the intending purchaser.

2. Want of a fair amount of breeding should be an absolute bar.

3. Reject a horse with a big, coarse head.

4. Reject a horse with a small, sunken eye. They are generally obstinate and sulky.

5. Reject a horse of a color light of the sort.

6. Reject a horse with a long, slack back. It will not carry weight.

7. Reject a horse with a hollow back. The formation is weak.

8. Reject a horse with flat sides. They will not do work or look well.

9. Reject a horse with a slack loin, *i. e.* undue length between the last ribs and hind quarters (sacrum). They are often bad feeders and will run up light with work.

10. Reject a horse with a light loin, *i. e.* want of breadth over the loins. They run up light with work.

11. Reject a horse with scraggy hips. They never do credit to feeding, particularly if also slack in the loins.

12. Reject a horse with a bad girth, *i. e.* "light through the heart." This formation will always cause trouble in saddling.

13. Reject a horse with a thick or short neck.

14. Reject a horse unless it has a good rein. With a clumsy neck the head is in consequence badly set on. Without a good rein a horse will never break well.

15. Reject a horse with very low withers. The saddle will be apt to work forward, and the "rein" will probably be deficient, and the leverage for the muscles of the forehand is defective.

16. Reject a horse if very short. There is not room enough for the kit.

N. B.—To see the above points (1–16) stand on the side and form your opinion before the horse moves off.

17. Reject a horse with a narrow or shallow chest. There is not sufficient capacity for the lungs.

18. Reject a horse with forelegs very close together. This and the former defect generally go together. To see these points stand in front.

19. Reject a horse whose forelegs are not straight. They will not stand wear. Stand behind the horse as he walks away from you, and you will be able to notice these defects if they exist.

20. Reject a horse which is light below the knee, especially if immediately below the knee. The conformation is essentially weak.

21. Reject a horse with long, or with short, or with upright pasterns. Long pasterns are subject to sprains. Short or upright pasterns make a horse unpleasant to ride, and on account of extra concussion are apt to cause ossific deposits.

22. Reject a horse with toes turned in or out. The twist generally occurs at the fetlock. Toes turned out are more objectionable than toes turned in. When the toes are turned out the fetlocks are generally turned in, and animals so formed are very apt to cut or brush. Both, however, are weak formations.

23. Reject a horse whose hind legs are too far behind. Good propelling power will be wanting, and disease as a result may be expected in the hocks.

24. Reject a horse which goes either very wide or very close behind.

25. Reject a horse with very straight or very bent hocks. The former cause undue concussion, the latter are apt to give way.

26. Reject a horse which is "split up" *i. e.*, shows much daylight between his thighs. Propelling power comes from behind, and must be deficient in horses

Digitized by Google

without good muscular development between the thighs.

27. Reject a horse with flat feet or overlarge feet, also with very small feet. Medium size are the best.

28. Reject a horse with one foot smaller than another.

Action must be light, easy, free and straight. Reject a horse that crosses his legs when walking or trotting. He will be unsafe. Freedom, power to move easily along, is the great point in a young horse. Knee-action is not essential; it will come with the bit and breaking.

A good walk is absolutely essential. Reject a horse that does not walk well; he is never pleasant to ride. If a horse walks well he will probably trot well, but a horse may trot well without walking well.

To ascertain whether the action is true and straight, stand behind the horse as he walks and trots away from you. You can not ascertain this important point by standing on the side.

Never omit to stand behind a horse as he walks away.

A good sloping shoulder is an important item in a riding horse, but bad action may co-exist with a good; and *vice versa* good, free action may co-exist with a somewhat straight shoulder.

Reject a horse that is straight in the shoulder and long from the point of the shoulder to the upper part of the forearm. This formation places the forelegs too much under the horse and makes him unsafe to ride.

You may have a plain horse, even if all the above very apparent defects are absent, but you will at least, have a serviceable one.

A horse should be rejected for any one really bad fault. The greatest strength of a horse is limited by his worse point. Horses are often bought because they possess one or more very good points. This is a wrong principle in buying. The selection of horses should begin by rejection for bad points. Bad points are, of course, in a great measure a question of degree. Discretion is needed in rejecting as well as in buying.

Having first of all kept clear of all absolute defects such as the above, select your horses for the presence of good serviceable, and handsome points, and easy, free, graceful carriage.

Hereditary Qualities.

"ANYTHING is transmissible." This is true of peculiarities of temper, motions of the members, formation of the whole body or any part of it. A careful observation made upon colts as they grow up will result in showing that they, as a rule, wear their shoes as they were worn by one parent or the other—that is, if the shoe had been worn off most rapidly on one side, or at the toe, or in any other manner, the colt, when shod and put into service, will wear its shoe in whatever peculiar manner the parent did.

A mare having a habit of removing all her bedding from under her, scraping it into a pile at the rear of her stall, produced a mare colt that from the first had the same habit and followed it up for thirteen years, to the writer's knowledge. If this mare had been bred from, the probabilities are that the progeny would have shown the same peculiarity. Not, perhaps, every colt—if she had borne several—but a portion undoubtedly would have been nearly, if not quite as likely to transmit the singularity as those that possessed it showing it in their actions.

The cow that domineers over the herd is quite likely to produce a progeny that will be self-asserting from the start. This will be especially shown at the trough, where a number of calves are fed. The calf from the "boss" cow will crowd the others from end to end of the trough, invariably pushing its way to the point where the most feed is to be found. The same is true of pigs. The practiced eye will at a glance pick out the sow that rules the herd when feed is thrown out. The careful breeder will remove this beast out of the way of temptation by keeping her in a separate yard, or at least confined to the company of those that are her equals in the direction mentioned, if there are any such in the herd. It is well to watch the young things that are growing up, treating these in like manner if the necessity appears.

Digitized by Google

Now, it shows a want of knowledge of one of the simplest rules in breeding if any one says this trait in a given collection cannot be, through weeding out, removed from it. These peculiarities of behavior stand out before the owner and keeper at every feeding and turning-in time, and they do not require to be judges of breeds, nor to be able to analyze the personal merits of animals as to their formation, etc., in order to be able to thoroughly eradicate objectionable mental traits from a given herd.

The behavior of animals forces itself upon the attention of the dullest comprehension, requiring no study, and, as stated, they will be found amenable to the breeder's art through the potent agency, "selection," or that absolutely effective plan, "feeding up for slaughter," which means weeding out in the most literal sense. These peculiarities of habit and temper force themselves upon the notice of every person at all familiar with domestic animals, and the dullest mind will, after a while, see that the slighest peculiarities are transmissible, appearing with unerring certainty, not in every individual of the progeny, but in so large a proportion that the absence forms the exception to the rule.

Now, but few take these facts at their full meaning and value, seeming to accept them as, in a measure, chance happenings, while in fact they are as regularly the outgrowth of the law of heredity as are a heavy horn, a coarse bone, or a drooping hip. These laws govern heredity in the brutes as persistently as they do in the human family, and to show how they cling to the latter, we will quote a few instances:

One authority mentions the case of a father who habitually slept on his back, with his right leg crossed over the left. He had a daughter who, while yet an infant, showed the same habit, and a continous effort to break up the habit proved ineffectual.

Some of the children of a family, the father having the same habit, continually, when unoccupied, moved the fingers of one hand in a peculiar manner.

A German authority, Hofacker, long since noticed that heredity was shown in the handwriting, the peculiar form of letters in the handwriting of the father being clearly shown in that of his son, though the latter received his lessons of various teachers.

We daily see families of boys who show in gait, mode of speech, features and general deportment that they have taken their peculiarities from a given source, and an examination of the parents will show at once from which parent the peculiarities have sprung.

Regarding singularities that appear in the outward markings, we have an account of an English family who, through many generations, showed a small lock of hair upon a particular part of the head different in color from the remainder. This peculiarity did not appear in all of the children—no peculiarity does—but was distinct in many of them.

The somewhat regular manner in which these peculiarities are duplicated in the offspring should be taken as a stepping-stone to our practice in "breeding out" what we do not approve of in a herd, and breeding instead exactly what we do want. This forms the essence of the breeder's art, and until a man has learned to take advantage of the hereditary tendencies toward good qualities and work away from those that bring bad forms, bad temper, sterility, tendency to short life, and to bring forth unpromising progeny, he is not worthy of being called a breeder of improved farm animals.—*National Live-Stock Journal.*

Tales of the Turf.

BY F. G. SMITH.

"Old breeders can afford to experiment, young men can not." Thus spoke Mr. C. J. Hamlin, during a pleasant chat while en route from Buffalo to Village Farm the other day.

"Then you prefer a trotting-bred dam to a thoroughbred?"

"As a rule, yes. Of course I had rather own the dam of Palo Alto, than an equally well-bred trotting dam, for the simple reason that Dame Winnie has proven herself to be a great producer. On the other hand I would prefer Beautiful Belle for she is a still greater producer."

"Did you not purchase several thor-

Google

ough-bred mares a couple of years ago to mate with Mambrino King, Chimes and other horses at Village Farm?"

"Yes sir. But remember I was very careful in the selection to purchase animals with great trotting action, that could show a three-minute gait. In deviating from my usual custom I had two objects in view. If the progeny of the thorough-bred cross upon my trotting stallions failed to produce extreme speed I would have a superior class of fillies to mate with another horse. If the experiment is a failure throughout, then others will profit by my experience and at my expense. I am not carried away with the idea, for the Almonts are my first love. The story that they are quitters has been exploded. I'd rather own a 2:10 quitter than a 2:30 pumpkin fair race hoss!"

* * * * * *

"SHORTER races, is the leading question of the hour," remarked Dr. J. W. Day in the corridor of a Rochester, N. Y., hotel a few evenings since.

"Then you are of the opinion that the seven and eight heat battles should be classed among by-gones?"

"Yes sir. We are moving rapidly these times, the public as well as the horses. We used to think that a horse that could go in 2:30 would do to start out for the money, and when he could go the route in 2:20 we pointed the compass directly for the Grand Circuit. Now those kind of horses won't do. They must be able to stop the chronograph down below the 'teens to insure even a part of the money. But going at this terrific gait soon tells upon the machinery of a horse. A locomotive running forty miles an hour will last twice as long as the iron greyhounds that whizz past a mile a minute. I would like to see the rules amended making all races to harness no longer than best two-in-three, with the privilege-to-lay-up-a-heat clause abolished. I think this plan would work better than Mr. S. A. Browne's idea. If I understand him rightly, he maintains that no race should be longer than five heats, the money being divided according to the entitled position of the contestants in the summary. In such an event a contest similar to the battle between Black Cloud and Jerome Eddy over the Buffalo track a decade ago would result in a draw, for each won two heats with one dead heat."

"What do you think of the single-dash system?"

"They are short and sweet! I like one every afternoon to chink in with. Under the best two-in-three plan you could have four races on every afternoon's program, including one single-dash event. One pacing race, a trotting event, then a single dash, and a stake race, how would that please the public? Variety is the spice of life."

"What is your opinion of the horse-breeding business of the future?"

"First-class horses will always command high prices. Ordinary animals will be cheaper. Large breeders will reduce their stock, but the animals kept for pleasure (?) will be higher bred, like the race horses of England."

* * * * * *

PROFESSIONAL starting judges are blossoming out as thick as white daisies in June. But how few are really starting judges! There are not over half a dozen in the whole United States. The "Cheap Johns" are dear at any price, and the majority of associations are beginning to realize it. A good driver always gets along with a good judge. Their interests are mutual, one should do his best to please the other, and this will be a pleasure to the public. An even start is important, and every reinsman can help to accomplish this. No judge wants to "call down" or fine a driver unless he is an important cheap John who wants to show his authority, yet at the same time it is a necessity at times to take the bull by the horns. Tedious scoring is out of the question. It is tiresome to the public, tiresome to man and beast. In no case should a starting judge be an associate judge in the stand. He should occupy a position below the other judges or even across the stretch where he can distinctly see every horse and driver. Two electric buttons, one leading to the hundred-yard post and the other to a gong directly in front of the wire are

Digitized by Google

preferable, but an old-fashioned bell at his right hand never fails. An assistant up the stretch is valuable, and a marshal who understands his business can do this work of closing them up. The pole horse should always be protected, for if he gets off in the rear he must go clear 'round all the others, and in fact, is worse off than the last horse at the word "go." The judges in the stand should be competent men. They can't be men of too much experience. This threadbare idea of asking a friend, a visitor whom you wish to honor, to act as a judge during the afternoon is a fallacy. He either knows it all, or he doesn't know anything! If capable men decline to act free, pay them. It will be money well spent. Fair play and justice will be meted out, and the public and horsemen will come again. Do not wait until the bell has tinkled for the horses before selecting judges, either. Engage them before advertising the meeting, print their names upon the bills to give more prominence to the fact that business will be business, and then there will be no more dillydallying at the eleventh hour. Attend to the little matters as well as the big ones. The temptation to many "Cheap John" starting judges to dabble with the pool box has had a bad effect upon many occasions. This is another point in favor of high-priced men. They earn enough money and will not run the risk of exposure even on a "sure thing." They don't know anybody when it comes to scoring and the drivers know they must do their duty or suffer the consequences. In all races where the amount of the entrance money exceeds the purse the race should be divided. It is nonsense to make horsemen trot for their own money. They might better make match races. In no instance should there be over fifteen starters, or two tiers, and the limit at twelve would be better. In case of more give the association power to split the race into two events with eight moneys instead of four. This would be fair to all concerned. Better starts could also be obtained and the rear horse would have some show of distinguishing himself while the reinsman would be thinking of something else besides "d—— the luck!"

Country Roads.

"HERE is a stretch of road with a turf strip on each side between the road and fences. The winding way, hemmed by greensward and shaded by trees, is picturesque at least. It is what people like to see in the country. They do not expect a curbed street with flagged gutters. The turfed sides provide a walk for those who go on foot—for all people in the country do not ride. This bit of road has not been mended for years; it needs no mending, it is hard, smooth, well drained, and can not be improved in any way, and if all roads were as good as it, nothing would be said about bad roads. But the 'highway surveyor' attacks the little strip of road in question and spoils it. He plows up the road-side turf and scrapes all turf, loam and sand into the middle of the road, 'rounds it up,' and believes that he has rebuilt and improved it. This is a mistake. A clean, hard road is changed into a mudhole and a quagmire. Persons on foot have only the middle of the way, and when they meet teams, they are driven into the gutter ankle-deep in mud, for the surveyor plowed deep and made a gutter which gullies whenever the rain falls. The road will not be molested again for several years, and will gradually wear down and be safe to travel over again, about the time the surveyor or his successor appears and 'mends' again. In some places, farmers work out a part of their taxes by working on the highways, and in other places the town makes a contract with a farmer to keep the roads in repair. The farmer has no time for roads until his farm work is done in the fall, the worst time in the year to repair roads, when he plows and scrapes and rounds up. During the fall and spring, and perhaps all winter, if the winter is open, the new road is the worst on the circuit—a stretch of mud through which all teams and foot passengers must go. And they call this road improvement! It is not; the more this kind of road building is practiced, the greater is the inconvenience, the greater the wear and tear and the cost of maintaining all wagon and harness gear, and, forsooth, the greater the hue and cry about bad roads."—*Cultivator and Country Gentleman.*

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, JANUARY, 1893.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9, 10 and 11, each.....$ 5.00
All in one order..... 40.00
INDEX DIGEST (of first 10 Volumes)..... 7.50

Budd Doble's Campaign.

MR. BUDD DOBLE, America's premier reinsman, kindly furnishes the MONTHLY with the following statement of what his campaigning stable accomplished this season in the way of money-winning performances:

Name.	*Starts.*	*Amount Won.*
Nancy Hanks.....	13	$33,000
Martha Wilkes.....	11	12,200
Belle Vara.....	7	7,190
Jack.....	6	2,250
Prince Herschel.....	9	1,595
Lee Russell.....	5	1,050
Jimmie Temple.....	2	1,000
Reina.....	3	975
Tony V.....	2	900
Major.....	3	850
Expert Prince.....	1	375
Rosslyn.....	4	250
Vassar.....	2	250
Axle.....	1	150
		$62,035

Mr. Doble, with the modesty that is generally characteristic of those who reach eminence in any field of endeavor, says nothing as to what he accomplished in the way of giving fast records, in some cases extreme records, to several members of the string. With Nancy Hanks, for instance, he lowered the world's trotting record to 2:04, and drove the gallant little daughter of Happy Medium and a Dictator mare a number of miles better than 2:10. Then he gave Martha Wilkes a race record of 2:08¼, and a mark of 2:08 in a trip against the watch. No other man has ever had two trotters in his stable at one time to beat 2:10, but Doble carried three of them in his string this season, Belle Vara taking a race mark of 2:08¾. Jack reduced his record to 2:11 after a year's absence from the turf, and showed himself to still be capable of a good fight for the money. Jimmie Temple is a good illustration of Doble's skill as a trainer. This horse, richly bred, being by George Wilkes and out of the Mambrino Patchen mare that produced Jersey Wilkes, has been a puzzle to the various trainers through whose hands he has passed. A double-gaited fellow, he seemed to take more kindly to the pace than the trot, and three years ago last summer gained a mark of 2:23¼ at the first-named way of going. He could be made, by the use of weights, to trot, but was uncertain in races, and never a winner. Doble seemingly overcame all the difficulties, and at Chicago last August Jimmie Temple trotted one of the grandest split-heat races in the books, winning as he liked at the finish of the long battle and taking a record of 2:22½. Then there was Prince Herschel, a three-year-old, to whom Doble gave a record of 2:21, quite a creditable mark, even in these days of phenomenally fast young trotters. Lee Russell, a four-year-old, went into winter quarters with a record of 2:18¼. Reina reduced her record from 2:22½ to 2:13½, and hitched with Allorita went a mile in 2:15 at the first time of asking. Tony V. is a two-year-old, and he showed so fast in his races that Mr. Doble wrote his owner that the son of Vatican could take a mark of 2:15 if desired, the reply being to save him for battle with the three-year-old trotters of 1893. Major's record was reduced from 2:22½ to 2:14½. In the only start that Expert Prince made in the Doble colors he reduced his record from 2:27½ to 2:13¼. To Vassar, a three-year-old, was given a mark of 2.21¾, while Axle, two years of age, is credited with 2:26¼ as a result of Doble's handling. To accomplish all this in a campaign of fifteen weeks is marvelous. Three trotters with records better than 2:09, and a pole team in 2:15 the only time they were ever driven a public mile would be enough for most men,

Digitized by Google

but Mr. Doble supplemented it all with other performances that, were Nancy Hanks, Martha Wilkes, Belle Vara and the pole team out of the stable, would have made the campaign a notable one for any driver.

In this issue of the MONTHLY appears a portrait of Mr. Doble, and although innumerable representations of that gentleman's features have been made in publications of various kinds, every one who knows the man will unite in saying that the MONTHLY's picture is a perfect likeness. It represents Mr. Doble as his friends know him in private life, and of necessity gives a different appearance to his countenance than that which it ordinarily assumes when the great reinsman is engaged in a struggle for turf honors.

A Test for Sires.

ACCORDING to calculations by a Cleveland paper, the first fourteen names on the list of winning trotting sires for 1892 are:

Name.	*Record.*	*Starters.*	*Races Won.*
Happy Medium	2:32½	27	22
Guy Wilkes	2:15¼	17	22
Director	2:17	14	17
Alcyone	2:27	25	41
Electioneer	....	30	30
Wilton	2:19¼	17	18
Mambrino King	....	27	36
Young Jim	....	17	34
Pilot Medium	....	42	41
Simmons	2:28	24	26
Nutwood	2:18¾	38	28
Onward	2:25¼	48	35
Alcantara	2:23	31	36
Robert McGregor	2:17½	36	37

This information is interesting enough, as far as it goes, but if horses are to be judged simply by the gross amount of money won each season by their get, other things should also be taken into consideration, and one important factor in the matter would naturally be the percentage of races won by each starter of any named sire. In the tabulation above referred to for instance, Happy Medium leads, because of the fact that his daughter Nancy Hanks was the star performer of the year, getting $33,000 for specials of the total of $44,000 won by Happy Medium's get during 1892.

In order that an intelligent comprehension of the entire subject matter may be had, the horses should be arranged in their order of merit as regards percentage of races won by their get, and with this idea followed out it is found that the stallions above named would stand as follows:

Name.	*Starters.*	*Races Won.*
Young Jim	17	34
Alcyone	25	41
Mambrino King	27	36
Guy Wilkes	17	22
Director	14	17
Alcantara	31	36
Simmons	24	26
Wilton	17	18
Robert McGregor	36	37
Electioneer	30	30
Pilot Medium	42	41
Happy Medium	27	22
Nutwood	38	28
Onward	48	35

This method of figuring the season's work, which is unquestionably the only perfectly fair one, giving exact justice to every horse and showing partiality to none, brings out in rather bold relief the fact that when it comes to putting the standard on in a necessarily unprejudiced manner Happy Medium is only two removes from the bottom of the list, instead of being at the top. It is true that his get won the most money, but this came about solely through the fact that his daughter Nancy Hanks was the champion trotter of the world and received $33,000 for exhibitions against time. It will hardly be claimed, even by the most enthusiastic admirers of Happy Medium, that Nancy Hanks derives any more than half her greatness from him. On the the contrary it is the universal testimony of those who were acquainted with the great trotting mare Princess, the dam of Happy Medium, and who have also seen Nancy Hanks, that never were two animals more alike in form, disposition and gait. Another positive element in the pedigree of Nancy Hanks, and one that is looked upon by some horsemen with as much favor as the Happy Medium strain, is the Dictator cross which comes through her dam, a daughter of the brother to Dexter. It is of course true that had Nancy Hanks been allowed to compete in races with other horses this season she would probably have won every start, and in that event her sire would have made a much better showing as to percentage of races won by his get than he now does. But leaving aside consideration of the case of Happy Medium it is interesting to note that under this system of tabulation and consideration, a system which admits of no "scratches," or dodging the issue, such horses as Mambrino King—that only a little while ago was contemptuously referred to by some people as "the dude stallion,"—Young Jim and Alcyone, are right in the front rank, Young Jim leading all other stallions of the years by a decided majority, his get having won an average of two races each, which fig-

Digitized by Google

ures are approached by the produce of no other horse. This plan of tabulating the season's results also gives their true position to horses that may not have had any sensationally fast performers, such as Nancy Hanks, and it is by reason of this that Guy Wilkes and Director show up where they belong. They are a great pair of young sires, representing as they do the George Wilkes and Dictator branches of the Hambletonian family, each backed up in the female line by the Mambrino Chief strain of blood, Guy Wilkes being out of a daughter of Mambrino Patchen, while Director's dam was by Mambrino Chief. The dam of each of these horses has produced to such an extent that she is a member of the Great Brood-Mare list, and with this sort of breeding it is gratifying to those who believe in the unvarying progress of the law of heredity to know that these stallions, after making records respectively of 2:15¼ and 2:17 and proving themselves hard to beat when on the turf, are meeting with unusual success in the stud at an early age. On the other hand the fact can not be overlooked that Young Jim, whose get have won the largest percentage of races, is out of a mare that was largely running-bred, but inasmuch as this same mare, when bred to Wilson's Snowstorm, produced Jim Irving, 2:23, the only trotter to the credit of Snowstorm, it is evident that, whatever her blood lines, she, like some other mares of thoroughbred blood, threw trotting speed when mated with strongly trotting-bred stallions. With Young Jim and Alcyone first and second in the list given above, Guy Wilkes in fourth place, Alcantara in sixth, Simmons in seventh and Wilton in eighth place, George Wilkes has a total of six sons in the first part of the tabulation, with Onward, another son, bringing up the rear. In fact it is not until tenth position is reached, it being occupied by Electioneer, that the race-winning capacity of the get of any of the sires named falls as low as one, and when the percentage is less than one the only horses left (Happy Medium not being considered, on account of reasons stated above), are Nutwood and Onward. Nutwood is, according to the 2:30 standard, the greatest living sire, and by the same standard Onward is the greatest sire of his age. And yet when it comes to the only practical test by which a sire's merit can be accurately gauged—the race-winning capacity of his get—Nutwood and Onward are at the tail-end of the procession. This statement is not made to in any way disparage the two stallions named, because their greatness is so well assured as to place them beyond harmful criticism, but the facts are brought out as showing how differently the same thing may look when viewed from a variety of standpoints. There is no doubt that the popular slogan in relation to trotting sires from now on will be "what did his get win?" but the percentage of races won by the produce of any stallion, as well as the amount in dollars placed to their credit, should likewise be carefully considered.

Some Changes Needed.

A KENTUCKY editor has discovered that it is the deadhead system which has of late played havoc with the financial affairs of trotting tracks, and says that if the free-pass business is abolished there will be no lack of prosperity.

The Chinese, who must be credited with great intellectual fecundity, if nothing else, have a fashion, when engaged in battle, of distracting the attention of the enemy by a vigorous beating of a particularly hideous musical instrument known as a tom-tom. The Kentucky editor is doing a little fantasia on the tom-tom just now, but the attempt to attribute all this season's misfortune on trotting tracks to the fact that a certain percentage of the people who witness the races are admitted free at the gate, will hardly fool anybody who gives the subject rational consideration. Every man who has looked at trotting from a business standpoint and who has not permitted his consideration of the same to be warped by prejudice, is well aware that the cause of so many trotting tracks failing to pay premiums this year lies in the fact that their managers attempted to give entirely too much money in stakes and purses. It is a self-evident proposition that unless the sale of the pooling and restaurant privileges and the receipts at the gate amount to a sufficient sum to pay purses and keep the track in repair, to say nothing of the money invested in the plant, trotting meetings can not be successfully given. That is all there is to it, and it should be the first business of those who have the management of trotting tracks to estimate conservatively the probable amount of revenue from the sources named. It will not do to imagine, and from that false premise argue, that because ten thousand people assemble to witness a horse-race at large centers of population the same attendance can be relied upon in localities sparsely populated, the inhabitants of

Digitized by Google

which are in a large majority dependent upon weather and good crops for financial success.

Any man with half an eye for business could have foreseen that the scheme of "Wildcat" Jones, which consisted in giving enormous stakes and purses for a meeting at a little out-of-the-way Tennessee hamlet called Columbia, was on its face preposterous. Nobody was surprised when the Jones bubble burst. It was not entirely unexpected when the track at Grand Rapids, Mich., found itself unable to pay from the gateage at its meeting a series of stakes and purses aggregating $30,000. The failure at Des Moines, Iowa, was the natural consequence of building an expensive track and imagining that the public would pay for it the first season it was opened. The same kite-flying tactics were responsible for the failure at Mexico, Mo. The people who ran the track at Richmond, Ind., were also afflicted with ballooning tendencies, and other instances of less prominence could be adduced. The enforced liquidation of the associations named has done the trotting-horse business a service instead of inflicting upon it an injury. The owners of trotters are beginning to see that race tracks can be managed just as inefficiently and with as much dishonesty and disregard of plain business principles as can savings banks or other institutions which depend upon public confidence and support for their success. They are also learning that it does not pay to ship horses from one place to another every week during the trotting season.

In other words, under the present system, of campaigning trotters the fixed charges against a horse in the way of training, driving, attendance, entrance fees and freight bills are so large that from a business man's point of view the investment of money, even in animals of tested speed, is not likely to prove remunerative. The owners of trotters see that on the running turf matters are managed from a practical standpoint, and with worldly wisdom. Running meetings of from three to six weeks' duration are given at all the large centers of population, but it is not attempted to ship from one little town to another, over thousands of miles of territory, the most valuable horses on the running turf.

Owners have learned that the only way in which it is possible to maintain a racing stable which shall pay expenses is through the medium of meetings where a horse may participate in from ten to twenty-five events. By thus centralizing and concentrating the business, the affairs of the running turf have been brought to a point where there is a minimum of expense to horse owners, with the possibility of rich rewards to the owners of winners. Exactly the opposite is true on the trotting turf. A Chicago man last summer owned a mare which started out with a record of about 2:23, won four races out of seven in which she started, made a record better than 2:12, and still did not pay expenses. This remarkable condition of affairs was due to the fact that two of her winning races were trotted at Richmond, Ind., a place which failed to pay its purses. Although this case may have been an exceptional one, it is a notorious fact that only the fastest trotters of the year bring in any revenue to their owners, and that the vast majority of the horses which appear in trotting and pacing races are an expensive luxury which can be afforded only by the wealthy. This state of affairs can not long endure. The trotting-horse business, as shown by recent auction sales of well-bred stock, is getting down to bed rock in the matter of prices. The next important move must be in the direction of a sweeping change of policy as regards the management of turf events. Heat races must be so modified that there will be no long contests. Meetings of three weeks or more must be given in the larger cities, and the offering of sensational stakes on an unbusinesslike basis must be abandoned for good.

As to Inheritance.

THE editor of a Boston paper, which is a thick-and-thin advocate of close crosses of thoroughbred blood in trotting pedigrees, says in a recent issue:

> "We quite agree with those who claim that Abdallah was the most successful trotting sire of his day. It was beyond his power, however, to transmit qualities which he did not possess, either by inheritance or acquirement. If his progeny possessed some qualities not found in Abdallah nor his ancestors, it s our belief that they inherited those qualities from some maternal ancestor. The law of heredity does not vary to accommodate the opinions of man."

This is a very plain statement of a common sense truth, which is backed up by a law of nature, and it is a pleasure to note in the Boston editor a return to grounds of logical reasoning in considering questions connected with the breeding of the light-harness horse. At the same time it is surprising to find in a journal, which only a little while ago was trying to show that Nancy Hanks carried forty-

Digitized by Google

seven per cent. of thoroughbred blood in her pedigree, and which is forever arguing that the merits of trotters of the present generation are due in no small measure to the fact that some of their remote ancestors were thoroughbred, so plain and comprehensive a statement of the basic principles of heredity.

That an animal can not transmit what he does not possess is, as the Boston paper states, strictly true when the words are taken in their literal sense; but it is not by any means true in the broad application of the term, because there have been undoubted instances of horses having no trotting speed of their own begetting a large proportion of such speed in their foals. In such cases we must look beyond the sire himself for the source of the trotting instinct, and the fact that in one generation it is suppressed does not at all prevent it from coming to the surface again in succeeding generations. At the same time it is an unquestioned fact that a horse which himself trots fast has a better chance of getting trotters than one which has no trotting speed. If the Boston paper believes, as it says, that animals can not transmit that which they do not possess, why does it continue to argue that the blood of the thoroughbred running horse is in any degree valuable in forming the pedigree of a trotter? The talk about "a thoroughbred foundation," which advocates of the running-blood fad fall back upon when everything in the shape of fact and argument fails them, is rather too nebulous to have much weight, in the face of the fact that stallions with fast trotting records and mares that have beaten 2:30 are producing a large proportion of the sensational performers of the present era. The truth of the matter is that the breeding of the trotting horse is still in its infancy, and yet so rapidly has it advanced that ideas which a decade ago would have been considered figments of a diseased imagination are now looked upon as logical conclusions.

The Boston editor thinks the progeny of Abdallah could inherit from him only qualities which he possessed, and admitting that the general trend of this idea is correct it follows that the more prominent a certain quality is in the sire the more likely it is to be reproduced in his descendants. It is for this reason that many of our most noted young sires are horses with fast records. The only three stallions to have ten in the 2:30 list at ten years of age are the developed trotters Baron Wilkes and Stamboul, and the trotting-bred pacer Sidney. It is hardly possible to conceive that this result is accident. Had all three of the horses which are credited with ten 2:30 or better performers at ten years of age been not only without records but devoid of speed, it would have been claimed by the advocates of the non-development-in-sires idea as a great card for their side of the argument, and in the use of the words "developed sire" it is not meant to carry the idea that a horse to get within the provisions of the phrase must have made a record of 2:30 or better. It is simply used to state the fact that a horse has more than the average amount of trotting or pacing speed. Belmont had no fast record, but he could trot better than 2:30, and there are many other instances of like character. The fact that such famous sires as Guy Wilkes, Sidney, Baron Wilkes, Quartermaster, Chimes and many others have a high rate of trotting or pacing speed, is unquestionably an important factor in their success, and were this not universally recognized by breeders and producers of trotting stock there would be absolutely nothing to go by in the raising of such horses. That speed is the principle thing sought for will not be denied, and if it is not a tenable proposition that speed is more likely to come from speed than from any other source, then breeders might as well mate slow horses with slow mares, instead of doing exactly the opposite. It is fast records that sell horses at high prices for use in the breeding ranks, and the same is true of mares. If they are bred in lines which have produced great numbers of trotters so much the better, but even if this be lacking it is still true that a sensational amount of speed will bring about the sale of a stallion at a long price and fill his book at a high fee until it is demonstrated that as a sire of speed he is a failure. It was Nelson's record of 2:10 that caused offers mounting well into the tens of thousands to be made for him, because his pedigree is not a fashionable one. It was this same mark of 2:10 that brought mares to his embrace at a high fee, and without the record his book could hardly have been filled at $50.

A Fraudulent Pedigree.

AN Ohio breeder of trotting horses writes to the MONTHLY as follows, inclosing a stud-bill of a horse called Toltec 297: "How about the enclosed? I am unable to find him with any number."

Digitized by Google

The answer to this is that the pedigree of the horse as given is a fraudulent one, and that the animal is in nowise entitled to the number 297, or any other number for that matter, which would certify to his being bred in standard lines. It is a plain case of stringing together some blood lines, making statements in connection with them that are obviously incorrect, and then tacking the whole on to some scrub and offering his services to the public—or at least that portion of it which evinces a readiness to be gulled—at what would be a moderate fee for a stallion of any pretensions as to pedigree. Here is the card:

"The standard-bred bay stallion Toltec No. 297 will be kept this season at the stable of the owner, J. M. Kemper, Brownsville, Ohio.

"This is a large, fine dark bay horse, 16 hands, heavy mane and tail. He traces three times to Mambrino Chief 11; twice through Clark Chief, his greatest son, and once through Woodford's Mambrino, his fastest son, backed by thoroughbred.

"This horse has never been trained. He is a sure foal getter. His colts come fine size and all bays. He is sold because I have two stallions out of same mare. This fellow is perfectly gentle, level-headed and a grand road horse; drives nicely with or without blinds.

"PEDIGREE—Toltec 297, Bay stallion, foaled 1887. Bred and owned by T. A. Green, Pleasureville, Ky. Sired by Ganymede 2485, son of Princeps 536 (sire of 23 from 2:30 to Trinket, 2:14, and dam of seven from 2:30 to 2:19), by Woodford's Mambrino 345, (sire of 12 in 2:40 list), by Mambrino Chief 11., dam Pearl, by Hambletonian 10; second dam by America Star 14.

"First dam Ida Reid, by Clark Chief Jr., 2:10, son of Clark Chief 89, (sire of six from 2:30 to 2:19¼) by Mambrino Chief 11, dam Virgie, by Abdallah 15. Second dam by Dick Turpin, son of Clark Chief 89. Third dam by Nichol's Cabot, by Benton's Diomed. Fourth by McKimmon's Whip, by Blackburn's Whip."

This queer jumble about "Clark Chief Jr., 2:10," etc., should deceive no one, but the neighbors of Mr. Kemper should call on him for an explanation. One fraudulent thing in connection with the card of this stallion is the statement that he is standard and registered under the number 297. That is enough to condemn the whole outfit.

Drop the Nelson Case.

WHAT is the matter with letting the Nelson case drop? For two years or so the Maine man and his stallion have been before the public, now as martyrs, and again as villains of the deepest dye. Editors of papers which disagreed with each other as to the justice of Nelson's expulsion, the motives which prompted it, and the means by which it was continued in force, have assailed each other—entirely through vociferousness, however—in the fiercest possible manner. At first the slogan of the Nelsonites was that the horse was kept off the turf for the reason that the owners of other fast stallions feared he would beat the record for entire horses. But since then Stamboul, Kremlin and Palo Alto have trotted faster miles than Nelson was ever able to put to his credit, so that dazzling firebrand of fancy has been quenched in an ocean of fact. The people who own colts by Nelson have been held up as suffering untold financial loss because the sire of their stock was not permitted to trot on the big tracks, forgetting that he was sneaked in through the back gate of one Grand Circuit course this season on the occasion of a county fair, and while the owners of the track, a member of the National Association, by the way, invoked in vain the strong arm of the law, was sent against his 2:10 record and could not equal it. The fact that Nelson was barred from certain tracks, or from all tracks, for that matter, did not prevent the owners of Nelson colts from training those interesting infants and showing their speed in public, did it? There has been altogether too much sympathy of the maudlin variety wasted in this matter. Nelson, by his own confession, transgressed the most important vital law of the trotting turf, and he was punished therefore. His punishment has ceased. Let him show by his future conduct that he has profited by the experience.

Stamboul and Kremlin.

QUESTIONS have been raised in certain quarters regarding the 2:07½ performance of Stamboul at Stockton not long since. Statements have been made by reputable persons which leave no doubt that, in some particulars at least, the strict letter of the rules regulating such affairs was not carried out. Whether or not there were vital omissions of acts that it is imperative should be accomplished in order for the performance to become a record is an open question.

The assumption that the American Trotting Register Association will or will not accept the 2:07½ mile of Stamboul as a record is entirely gratuitous, inasmuch as the matter has not yet been brought up for consideration and action. It may be stated as a matter of news, however, that evidence has been submitted for the purpose of showing that the rules in regard to time performances at the meeting at which Stamboul's best performance was made were complied with. But is it not clear how the stallion

Digitized by Google

could properly have been started several days after the last day of the week in which the meeting was held, as the rules provide that in such cases all races not started shall be declared off. Investigation as to all these points is being made through the proper channels, and when it is complete the matter will be passed upon, but not before.

The contention that the Register Association has nothing to do with the record of a horse after the animal has trotted in 2:30 or better will not hold. For purposes of registration any record is open to inspection, investigation, and determination by the Register Association. It is true that whether Stamboul's record is 2:07½ or 2:30 would not affect the registration of foals, but that does not cover all that is embraced in the words "purposes of registration." The Year Book is one of the publications of the Register Association, and in its Great Table, for instance, it is necessary that the record of every 2:30 sire be given. Any statement on this point by the Year Book clearly comes within the meaning of "purposes of registration," and is an important part of the statements made regarding the horse. The records of horses that are beating 2:10 should be scrutinized as closely as in the case of a stallion that is trying hard to beat 2:30, and they will be.

In the meantime it may be said of Stamboul that on December 20 he was sold at auction in New York city for $41,000, the purchaser being Mr. D. H. Harriman, a New York banker, who has a farm in Orange county. The price is not an extravagant one, but it shows conclusively that when good breeding, individuality and demonstrated producing power are combined in an animal there is no difficulty in disposing of stock of that character at figures which indicate that the market was never in a firmer condition for the right sort of goods. Kremlin, whose record of 2:07¾ is but a quarter of a second slower than that of Stamboul, provided there are no fatal objections to the California stallion's best mile, will stand at a $400 fee, a far more moderate price than has of late years been asked for the services of a champion stallion. Kremlin is the champion five-year-old of the world, he has the fastest record by a stallion on a regulation track, and a combined time and race record faster than any other stallion, the figures being 2:09⅜, while his five-year-old record of 2:07¾ puts all the pacers of that age, as well as the trotters, to the rear.

Sable Wilkes and Blanche.

MR. WILLIAM CORBITT, owner of Guy Wilkes and Sable Wilkes, writes from San Mateo, Cal., under date of December 12, as follows: "I notice you credit Sable Wilkes with six new performers in the 2:30 list. Sable Wilkes had seven representatives enter the 2:30 list in 1892, making a total of ten in the 2:30 list to date. His first foals were foaled in 1889, making his oldest get three years, and as I have made no special efforts to secure records for them outside of their races, it makes the showing for him one that is unapproached by any stallion of his age. I also notice the claim that Beautiful Bells is the only mare having four of her produce in the 2:30 list at fifteen years old. Blanche, thirteen years old, by Arthurton 365, is the dam of Hazel Wilkes, 2:14¾; Una Wilkes, 2:15; Native Son, 2:26½, and Silver Spray, 2:28." We are obliged to Mr. Corbitt for the information conveyed in the above. The list and tables made up to the present time in the MONTHLY have been based on the best information that could be obtained relative to the performers of 1892, and, of course, the statistics are incomplete and not always correct. There can be no accurate account of what has been done in the way of trotting and pacing during the season just closed until the Year Book is compiled, which work will be completed about the middle of February.

In Relation to Blue Bull.

The Kentucky Stock Farm of a recent date has the following interesting facts in relation to the well-known sire of trotters, Blue Bull, and, as the history of that horse has been at all times more or less the subject of dispute, the letters will be read with interest.

ROSS, BUTLER COUNTY, October 29.

In the *Kentucky Stock Farm* for April 28, 1892, you reprint an article from the *Western Horseman* by James Alexander, giving his idea of the breeding of Blue Bull 75, and you say, as a prefix to this article that you had, in a previous issue of the *Stock Farm* arrived at about the same conclusion, and that both agreed that Blue Bull was a *Sam Hazzard*. Living, as I do, in the earliest definitely known home of the Blue Bulls, and knowing that your conclusions were at variance with the generally accepted breeding of the Blue Bulls by the people here, I sent the paper to Mr. Abner Francis, of Paddy's Run, Butler county, Ohio, a gentleman who I knew had given a good deal of time and labor to get as much of the exact history and breeding of Mering's Blue Bull as probably is possible at this distant day. Mr. Francis is a gentleman upward of sixty, has always lived in Butler county, has

always been a close observer of the horses of his county, and is also very careful of any statements he may make. He was sick a good portion of the past summer, and did not send me the enclosed MS. until a few days ago; but as a matter of history it will be in place to publish it at any time.

Mr. Wallace gives Wilson's Blue Bull as a grandson of Mering's Blue Bull, but gives Mering's Blue Bull as breeding and history unknown. You will observe that Mr. Francis only speaks of what he knows concerning this same *Mering's* Blue Bull. (My understanding is that this man Mering was a breeder.)

The older horsemen here all say that Mr. Wallace is correct in giving Wilson's Blue Bull as being by Pruden's Blue Bull, and that Pruden's was a son of Mering's. The student will please bear in mind that this was the original home of the Blue Bulls, and that Butler county, Ohio, lies adjoining Dearborn and Switzerland counties in Indiana. Yours,

A. C. TURNER.

Mr. Francis writes as follows:

The horse known as Mering's Blue Bull was brought by Mr. Snively from Chester county, Pa., to Hamilton, Ohio, about the year 1820, when he was a two-year-old, and while there was kept mainly as a stock horse. About the year 1825 Mr. Snively sold him to John Mering, of Morgan, Butler county, Ohio. Mr. Mering made perhaps four or five seasons with him in his own neighborhood, and then sold him to a party in Dearborn county, Ind. Your correspondent has no knowledge of him from this time until about the year 1838, when an Englishman named Grisley, who lived in Crosby township, Hamilton county, Ohio, was in Cincinnati on business, and while there met a man with whom he was acquainted, and who was the owner of Blue Bull. He purchased the horse from his friend, took him to his farm and kept him as a breeder until about the year 1842, when he died. While Mr. Grisley had him he was very popular, and did a large business at a small service fee.

Blue Bull's sire came from England, and his color was a golden dun. His dam was a large black Canestoga mare used in a team in hauling goods west over the Allegheny mountains—a breed of horses well calculated and extensively used for teaming in those days. Blue Bull's color was a blue or mouse color, and had some white on his legs, with a broad, white blaise in his face and a black streak along his back. He was of medium size, very compact in form, and of great substance; his neck was short and thick; his ears were short and near; he was well ribbed, closely coupled, hips rather wide, and rump somewhat steep. He was a pacer, and, while no claim was made for him as to speed, he was quite active. His colts were generally blue or dun, with the distinctive black streak along the back, and for the wagon, plow, or general business, were well adapted for his time.

A Mr. Snively, now living north of Hamilton, is a relative of the party who brought Blue Bull from Chester, Pa. Mr. Grisley was drowned while trying to cross the Miami river with a colt. His widow, now Mrs. Clendenning, recently lived in Cleves; his daughter, the wife of Mr. Knose, recently lived in Miamitown. Maj. Joyce saw Blue Bull soon after Mr. Grisley bought him.

Blue Bull was known and advertised by the name of Ohio Farmer, until he was nicknamed Blue Bull, while Mr. Mering owned him, and about which the owner was very indignant.

Notes and News.

"STARTING for a drive with an acquaintance," says a writer in the New York *Tribune*, "I noticed that his spirited young horse was so eager to go as to be scarcely manageable. Before we had gone a quarter of a mile he had stopped at a water trough and allowed the animal to drink unreasonably. At once all the spirit vanished; he became a tame driver, and for miles had to be urged with a whip, being as uncomfortable as he appeared and more so than slight thirst would have made him. This folly I have often seen committed by men at work in the field. Too much water (to say nothing of other drinks) would unfit them for activity during an hour or two, because of depressing fullness. On a long overland carriage drive with my wife, she thought it hard not to let the horse drink largely every mile or two, but at the end of the first day she changed her opinion. Sweating profusely, he could hardly be urged out of a walk. Following days, with reasonable drink and light hay rations, except at night, he proved himself a different horse. Drivers ought to remember that a horse can not derive nourishment from food or drink while in motion, and that these things only cause misery after the momentary gratification of appetite. The strength must be accumulated or fat laid on while at rest, and it is more economical of both to give the horse but little food and only a swallow or two of water frequently while performing his duty. Arabs of the desert, the world's best horsemen, never feed except at night. Their beasts are universally noted for soundness of wind and limb, freeness, fleetness and good disposition. This is not considered cruelty, but kindness, and their horses are treated with extreme humanity in every other way. Use reason with the horse both on the road and in the stable. While he is idle don't let him eat more than two hours at meal time. Horses that eat all the while soon become diseased or useless."

MR. GEORGE H. MILLS, of Goshen, N.Y., owner of the well-known sire Sweepstakes, a stallion of the Hambletonian-Star strains of blood, takes the MONTHLY severely to task because in its December issue, speaking of the stallions that have had five or more of their get become standard by performance in 1892 it omitted Sweepstakes. It seems that on November 12 Cranston, by Sweepstakes, won a race at two-mile heats against Full Prince, the latter capturing the first heat in 4:54½, after which

Digitized by Google

Cranston went to the front in 4:55½, 4:55, 5:01. This gives Cranston a record of 2:27½ and makes five that Sweepstakes has put in the list this season. Mr. Mills also says: "It is well enough for men who never bred or trained a trotter to cry for a higher standard, but let them put in a trainer's hands some colts for the purpose of having them beat 2:30, and when they have done it and paid the bills they will find the business unprofitable enough, making them standard by the records at that mark without making it 2:20, or even 2:25."

THE thoroughbred mare Dame Winnie, the dam of the trotters Palo Alto, 2:08¾; Big Jim, 2:23½; Gertrude Russell, 2:23½, and Paola, 2:28¾, died December 14 at the Palo Alto farm of Senator Stanford in California. Three of Dame Winnie's quartette of 2:30 or better trotters were by Electioneer, Big Jim being by General Benton. Paola is the youngest of her foals to make a record. He was foaled in 1887, and for the following two seasons Dame Winnie did not produce. In 1890 her foal was Altico, by Electioneer, and in 1892, Pacheco, by the same horse. In 1884 she produced Diabolo, by the thoroughbred stallion Shannon, and before being taken to California was bred to Smuggler, 2:15¼, but the resultant foal died. As the dam of Palo Alto, Dame Winnie will always have a prominent place in trotting-horse history.

THE idea that we are rapidly reaching a point where only race records will effect values certainly has not yet been indicated by the prices. The highest price at which any trotting horse has yet been sold was $125,000, which was for the colt Arion, with a two-year-old record *against time*; the next highest price was $105,000, for the three-year-old colt Axtell, and that value was also based solely upon a performance against time. We recollect that when this sale was made the same writer predicted that the purchasers would never see their money back. That sale was not very long ago, and yet, though they have not had the best of luck with their purchase, they have considerably more than got their money back, and could, by closing out the transaction to-morrow, declare a dividend of not less than fifty per cent.; whereas, had that $105,000 at the same time been invested in the breeding of carriage horses in the same locality, there is no probability that the stock could be closed out to-morrow to any better advantage than at a loss of at least 50 cents on the dollar.—*Horse eeder.*

THE assertion that the Hackney with a long journey and a moderate load will outdo the trotting-bred horse will be accepted by but very few. The average Hackney has but very little speed for either a long or short distance, unless vertical action is counted, as some of the most popular Hackneys seem to step very quickly and very high, but finally place their feet at almost the same spot from which they were taken. On one occasion a horseman remarked of a very showy Hackney that he evidently put his feet down a little back of the point from which he took them up. That certainly would give progress, but in decidedly the wrong direction. If any of the Hackney enthusiasts wish to test the point of relative speed by a match against the trotters, they can undoubtedly be accommodated for as long or as short a distance as they wish, and either just for fun or for as large stakes as are desired.

THE officers of the Northwestern Association of Trotting and Pacing Horse Breeders for the coming year are: President, Hon. John L. Mitchell; vice-presidents, Jackson I. Case, Henry C. Jewett, W. P. Ijams, George W. Sherwood, Edward Martin, W. H. Raymond, C. F. Emery, S. A. Browne, Milton K. Kirk, E. D. Gould, W. I. Hayes, W. A. Sanborn, Bradford Du Bois, A. C. Beckwith; treasurer, H. D. McKinney; secretary, Robert L. Allen; board of censors, John L. Mitchell, Jackson I. Case, John W. Conley, S. Baker, W. A. Sanborn, Walter Clark; board of racing stewards, John L. Mitchell, A. J. Caton, F. S. Gorton, H. D. McKinney, S. A. Browne, Jackson I. Case, R. L. Allen.

ON the list of the largest winning owners of racehorses in England during the past season Baron Hirsch easily reached the top, $165,000 being in round numbers the sum of his winnings. This is the largest amount captured by any one owner in England since 1889, when the Duke of Portland headed the list with more than double this sum to his credit. Early in the campaign of 1892, which season closed three weeks ago, the colors of Sir J. Blundell Maple seemed well nigh invincible, but fortune towards its close was not so kind, and though the total he has won in stakes represents the substantial sum of about $85,000, it has been nearly doubled by Baron Hirsch. To the splendid three-year-old career of La Fleche he is indebted for by far the greater part of the amount won, and the series of valuable prizes

Digitized by Google

which fell to the share of the daughter of St. Simon made it evident that the Baron would stand well out as chief winner. Colonel North comes third on the list with $77,000, won by a string of nineteen horses. Thanks mainly to Orme, the Duke of Westminster is credited with about $73,000, and comes fourth, while Mr. C. D. Rose takes fifth place with $60,000. Gen. O. Williams fills sixth position, and is indebted to Perigord for more than half the $55,000 which he got, while Mr. J. Charlton follows next in order with $50,000 as his share of the proceeds of victory. In France the list is almost as formidable, although there are a lesser number of heavy winners, the money having found a wider distribution. Twelve French horse owners, however, won sums over $25,000. Baron de Shickler heading the list with $130,-500, and M. Edward Blanc coming next with $115,250.

THE Southwestern Circuit has materialized for 1893, the stewards or secretaries having met at Chicago on the 7th inst. and arranged the dates and order of the circuit. A clash of dates occurred, the Northwestern Breeders having decided upon a two weeks' meeting, which occupies the time of one week originally selected by C. W. Williams at Independence. Then Joliet wanted to give a meeting to follow Chicago, but to this Mr. Williams would not listen, declaring that if crowded farther he would give his meeting on the same dates selected by Chicago. Finally a compromise was effected and the following program and dates decided upon: Some of the dates are duplicated, but the large number of members does not admit of separate dates for each. Sturgis, Mich., July 31 to August 5; Grand Rapids, Mich., August 7 to 12; Chicago, August 14 to 26; Independence, Iowa, August 28 to September 9; Mason City, Iowa, September 11 to 16; St. Joseph, Mo., September 18 to 23; Columbus, Ohio, August 28 to September 2; Indianapolis, Ind., August 4 to 9; Columbus, Ind., August 18 to 23; Terre Haute, Ind., August 25 to 30; Evansville, Ind., October 2 to 7; Chillicothe, October 9 to 14; Nashville, October 16 to 28.

IF a man understands his business it does not matter what time of the year the animal is castrated, for I have fixed ten within three weeks, and 197 since April 9, 1890, and no man ever saw one take a stiff step or leave a feed on account of the operation. When people use the hot irons or chaining process they must expect them to be stiff, and they must have the weather just right and lose some any way. If any one interested in this subject will write to any horseman in Worcester they will find that I have stated facts. I will castrate any horse and trot him in a race any day of the same week, and guarantee him to stay up. I think I am the only man to advertise in your paper to warrant any man's horse for five per cent. of value.—*Exchange.*

KALAMAZOO Farm will have a star for the slow pacing classes in the roan colt Vasser, brother to Belle Vara. Doble says that the lateral gait is the youngster's favorite and that he can simply fly. Should his predictions connect, the records that W. Wood, Manager and Robert J. put up for four-year-olds to shoot at may take a tumble.

AT the annual meeting of the New England Trotting Horse Breeders' Association held in Boston on Wednesday, December 7, the following officers were elected: President, John E. Thayer; vice-presidents: Maine, F. H. Briggs and M. T. Pooler; New Hamphshire, Warren F. Daniels and F. L. Gerald; Vermont, H. T. Cutts and G. W. Henley; Massachusetts, J. Malcolm Forbes and H.G. Wood; Rhode Island, F. E. Perkins and J. S. Brown; Connecticut, S. H. Rundle and Albert C. Hall. The association has over $4,000 in the treasury.

RUSSIA is the largest horse breeding country in the world, but the great majority of their horses are worthless brutes—worse than our Texas ponies. The government maintains twenty-eight breeding establishments, which are classed in three categories—stables for the improvement of the draughtand working breeds; those destined for saddle horses, and finally the Steppe stables, which supply mounts for the cavalry. These establishments contain in all 1,843 stallions. Of these 891 belong to the fourteen stables of draught horses which are concentrated in the central government, 549 in the saddle horse stables established in the southern governments, which also have large studs of race horses; and 403 stallions in the several Steppe stables situated in the region of the Don, in that of the Ural, and of the Caucasus.—Exchange.

Now that the various New York racing associations are making their annual returns on their taxable gate receipts, it becomes evident that there was a marked decrease in the attendance as compared with the previous year. At Morris Park the biggest crowd of the season

was that of Decoration Day, when $23,160 was taken in for admissions. This was in the spring, but during the fall meeting $5,353 was the largest daily receipts. The heaviest day at the Coney Island Jockey Club's grounds was naturally Suburban day, when $19,907 was the taxable sum taken in. Labor Day was the next largest, $11,700 being taken in at the gates on that occasion, while Futurity day realized but $9,280, all of which sums appear comparatively insignificant when compared with the immense amount of money given in stakes and purses.

Questions and Answers.

T. S., CONNERSVILLE, IND.—1. Is Tamora 5198, duly registered and recorded as stated in my communication? Also give name of last recorded owner. 2. Give breeding and 2:30 performers of Vanguard 1603.

ANSWER.—1. Tamora 5198 is registered as standard (under Rule 6) in Volume VI, American Trotting Register. His last recorded owner was G. M. Glass, Napoleon, Ohio, and the transfer to him recorded in Volume X. The pedigree as stated in your communication is correct in every particular. 2. Vanguard 1603, b h, foaled 1868, by Dictator 113, dam Patti, by Mambrino Chief 11; 2d dam by Parks' Highlander, 3d dam by Grey Eagle, 4th dam by Bertrand, 5th dam by Mendoza. Bred by R. P. Pepper, Frankfort, Ky. No 2:30 performers.

WHAT will Sidney bring? Mr. W. C. France entered into a contract for his services for three years, by which he was to pay $20,000 per year, with a contingent additional amount of $5,000 per year, making a certain aggregate of $60,000, and a possible one of $75,000, for that short period. This contract, which, by its conditions was terminated by the death of Count Valensin, Mr. France offered the executors of the estate to renew.

Count Valensin was offered and refused $100,000 for Sidney.

With these facts before you as a guide, what is your estimate of the amount which the horse will bring at his sale by Tattersalls in February?

An elegant road driver's whip will be presented to the person making the closest guess.

Address, WILLIAM B. FASIG,
Manager Trotting Department,
Tattersalls, 55th St. and 7th Ave.,
New York City.

IN Humphreys' Veterinary Specifics you have a remedy for any particular disease or complaint. For colic, cough, founder, heaves, pneumonia, indigestion, disease of the kidneys or urinary passages, strains or lameness, you have, in compact, portable form, the Specific to cure it. You know just what to do, and how to do it. Their use is free from danger to the animal. In the usual treatment the medicines are either rank poisons or the most violent alteratives. It is a common experience, that, if the horse finally lives through the treatment, he is worthless from the effects of the medicines. Thousands of good horses are every year killed by drugs. In Humphreys' Specific system you are absolutely free from all such danger. They are simple. Being specifics for particular diseases, you know at once what to give. You can scarcely make a mistake. Even if you do, you have only lost your time, and have not killed the horse. When using the common veterinary drugs a mistake is often fatal. Manual free.

COL. R. G. STONER is one of Kentucky's pioneer breeders. Like the late R. A. Alexander, the founder of the celebrated Woodburn farm, his foresight resulted in success; but unlike Mr. Alexander he started a comparatively poor man, and has grown rich in the business of breeding trotters. It was not good luck, but good judgment and accurate foresight which led both these gentlemen to get the best horses of the day at the head of their respective studs. Mr. Alexander bought good things as they showed up from time to time. Norman, Abdallah 15, and Pilot Jr. were among his early purchases, and from this foundation the magnificent breeding establishment, known the world over as Woodburn farm, has grown into renown.

Col. Stoner went east and secured Strathmore, which we believe was the stepping stone to his success. From that time on he has bought and bred many horses that have made both themselves and their owner famous. Col. Stoner will sell eighty-one of as royally-bred ones as ever came to the block at Tattersalls-Brasfield exchange, January 20 and 21.

The Year Book, Volume 8.

THE Year Book for 1892 is now well under way, and will be issued as soon as complete and authentic information in regard to standard performers of the year, their sires

Digitized by Google

and dams is received and compiled. Breeders and owners of a new 2:30 trotter or 2:25 pacer or of the sires and dams of such animals can greatly facilitate the early completion of the work by at once sending in full information in regard to them, both as to pedigree and performance. Where the owners are known, letters have been sent from this office requesting such information, but in some instances the address of owners or breeders is not known, in others no answer has been received. Do not wait for a letter or specific request for information, but send in what you have at once.

The Year Book for 1892, will be published in two volumes, price $5.00, and issued, if possible, about the middle of February; it will be a valuable and comprehensive work on the records, pedigree and performance of the light-harness horse, a complete record of the most sensational year in the history of the trotting and pacing turf. Send in orders at once and avoid delay in receipt of the work when issued. The first orders received will be the first filled and sent out.

Our New Advertisers.

THE Allen Farm, Wm. Russell Allen, proprietor, Pittsfield, Mass., makes in this issue its announcement for 1893. Six highly-bred trotting stallions are offered for public service on very reasonable terms. The premier stallion is Kremlin, 2:07¾, the champion racing stallion and winner of four fast and hotly-contested races in 1892, by Lord Russell (full brother of Maud S., 2:08¾), dam Eventide (dam of three in the 2:30 list), by Woodford Mambrino; 2d dam Vara (dam of Vatican, 2:29¼), by Hambletonian 10; his breeding is of the most fashionable and prepotent trotting strains and his advertised service fee, $400, the lowest at which a champion stallion has for many years been offered to the public.

Lancelot, 2:23, by Messenger Duroc; dam Green Mountain Maid (dam of nine 2:30 performers and of Electioneer), is the champion five-year-old sire, being at that age sire of Leone, yearling race record 2:28½, and of Unkamet, two-year-old record, 2:27¾. Lancelot was in 1892 first started on September 21, and reduced his record at each attempt to 2:23 on November 12, over a regulation track. His service fee is placed at $200. His oldest son Unkamet, 2:27¾, dam Rusina (sister to Nutwood), by Belmont; 2d dam Miss Russell, by Pilot Jr., has also been placed in the stud. America, 2:23½, by Kentucky Prince, dam Alma, 2:28¾, by Hambletonian 10; 2d dam Clara (dam of Dexter, 2:17¼), by Seely's American Star, is next on the list of Allen Farm and at the astonishingly low fee, for a horse of his breeding and record, of $50.

Pistachio 13489, by Belmont, dam Miss Russell, by Pilot Jr., is full brother to Nutwood, and at six years old is sire of Guiado, three-year-old record 2:30, over a regulation track; fee for 1893, $100. Mazatlan 11770, by Electioneer; dam Rosemont by Piedmont; 2d dam Beautiful Bells, by the Moor, fee $200, is the last of this remarkable sextette of trotting-bred horses. Write to the Allen Farm for catalogue and full information.

The Tattersalls Companies in America again come to the front with a full-page advertisement of their Trotting-Bred Sales for 1893. The manager of the trotting department, William B. Fasig, has so clearly placed the merits and advantages of the organization before the public, that it is unnecessary to do more than call attention to the dates and places of sale, these alone giving an idea of the immense scope of their operations. They are as follows: Lexington, Ky., January 20–21, 30–31, and February 1, 2, 3 and 4; also in October during the meeting of the Kentucky Trotting Horse Breeders' Association. In Chicago, February 27–28 and March 1, 2, 3 and 4. At Cleveland, Ohio, February 7–12 and May 15–20. At New York in January, February and March, exact dates not yet decided on.

The Phenol Sodique advertisement makes its regular appearance in the MONTHLY, slightly changed in form, but as heretofore, calling attention to the specific as the best remedy for cuts, sores and inflammation in man or beast.

William Simpson, 91 Park Row, New York, proprietor of the Empire City Stud, is one of the oldest advertisers in the MONTHLY, and his full page announcement for 1893 contains a handsome picture of Electrician 5007, race record, 2:24¼, and his extended pedigree. This grandly-bred horse is by Electioneer, (the greatest trotting sire), dam Rebecca (dam of five in 2:30 or better), by General Benton; 2d dam Clara Belle (dam of Clifton Bell, 2:24¼), by Abdallah Star; 3d dam Fanny, by Hambletonian 10; 4th dam Emma Mills, by Seely's American Star. For full information, send for catalogue of the Empire City Stud, which will be issued March 1, 1893.

Digitized by Google

The Clover Dell Farm, Milan, Tenn., advertise three fashionably bred stallions for service in 1893 at fees that must secure a large patronage. A brief reference to their names and breeding will fully establish their value. Oceanus 9443 is by Lord Russell (sire of Kremlin, 2:07¾), dam Wavelet, 2:24½, by Belmont, 2d dam Waterwitch (dam of 6 in 2:30 list), by Pilot Jr.; service fee, $75. Captain Mac 7225 has a record of 2:29, by Nutwood (the greatest living sire), dam Rapidan (dam of Lockheart, 2:13, and 2 others in 2:30 list), by Dictator, 2d dam Madame Headly (dam of Expert Prince, 2:13¼, pacing), by Edwin Forrest; service fee, $50. Proctor 7224, record 2:19½ (pacing), by Pancoast, 2:21¾ (sire of Ponce de Leon, 2:13, Garnet, 2:13½, and Patron, 2:14½), dam Silence (dam of 2 in 2:30 list), by Alexander's Abdallah; 2d dam Woodbine (dam of Wedgewood, 2:19, and Woodford Mambrino, 2:21½), by Woodford; service fee, $25. The advocates of developed speed and producing dams will fully appreciate the value of these pedigrees. Either one of these horses is offered for sale at a reasonable price, also young stallions and fillies out of gilt-edged mares. Read the advertisement carefully and correspond with the proprietor.

The stallion Red Wedge 11278 will make the season of 1893 at Friendship, N. Y., in charge of D. L. Corbin. The advertisement contains his extended pedigree, terms of service and liberal offers of premiums for the first of his get to enter the 2:30 list; read it carefully and correspond with the owner, Allen L. Cranston, Little Genesee, N. Y. Red Wedge is by Red Wilkes, dam Ulva, 2:27, by Wedgewood, 2d dam Tulip, by Alexander's Abdallah, 3d dam Madame Dudley, by Bashaw Horse, 4th dam by May Day. He should be liberally patronized by the breeders of the section of the country in which he stands.

Dudley Miller, Oswego, N. Y., announces that he is agent for the sale of high bred trotting stock, including granddaughters and grandsons of Electioneer, George Wilkes and Nutwood. Correspond with him.

A. L. McCrea Jr., Patron Farm, Gouverneur, N. Y., has always something good in the trotting horse line to offer to the public; read his advertisement in this issue of the MONTHLY, and send for catalogue.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal.* The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

AMO-LEX 21353, (6) ch h foaled 1892; by Chestnut Wilkes 11410; dam Patronilla, by Patronage 4143; g d Flotilla, by Tramp 308, etc. [See Patronilla, Vol. VIII.] Bred by D. R. Mills, Des Moines, Iowa; passed to C. W. McIntyre, New Albany, Ind. [Vol. XII.]

ASHUELOT BOY 21548, (6) b h foaled 1891; by San Jacinto 4100; dam Molly Miller, by Guy Miller 861; g d Nelly Clay, by Harry Clay 45. [See Molly Miller, Vol. V.] Bred by P. P. Woodbury, Hinsdale, N. H.; passed to J. A. Stanford, Keene, N. H. [Vol. XII.]

BALDI, (7) ch m foaled 1892; by Oberlin Chief 3884; dam Iris, by Beaumont 370. Bred by James Dickson, Clinton, Pa. [Vol. XII.]

BECKY G., (6) br m foaled 1892; by Othello 16057; dam Maggie C. (dam of Good Time, 2:30), by Hambletonian 867; g d Flora, said to be by Bashaw 50. [See Maggie C.] Bred by J. M. Christy, Des Moines, Iowa. [Vol. XII.]

Bessie M., (2) gr m foaled 1885; by White Cloud (Braxton's); dam Fanny, pedigree not traced. Bred by William H. Martin, Bedford, Ind. *Record 2:21.* [Vol. XII.]

BLUEWOOD 21421, (1) dn h foaled 1886; by Tom Kirkwood 1587; dam Belle Hamilton, by Hamblehawk 508; g d Flora, by Bashaw (Hodgson's). Bred by Alexander Mackie, Springdale, Iowa; passed to L. Lightfoot, Manning, Iowa. Record 2:29½. [Vol. XII.]

BROMINUS, (6) bl m foaled 1891; by Bromo 13991; dam Lady Blanca (Nettie) (dam of Sherman Bashaw, 2:28), by Bashaw 50; g d by Grey Eagle (Lillie's). [See Lady Blanca.] Bred by W. D. G. Cottrell, Clarence, Iowa. [Vol. XII.]

CAPTAIN BOWMAN 21258, (1) ch h foaled 1887; by Ned Wilkes 3644; dam Kathrina (dam of Emma B., 2:26¼), by Daniel Lambert 102. Bred by E. Bowman, Rutland, Vt.; passed to Barrett & Hayes, Cascade, Iowa. Record 2:28¾. [Vol. XII.]

WINK, (7) b m foaled 1892; by Oil Prince 10680; dam Molly Williams, by Truman Allen 7413; g d Williams Mare, pedigree not traced. Bred by W. C. Farnum, Wellsville, N. Y. [Vol. XII.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

FATA MORGANA, b m foaled 1882; by Flying Cloud 17806; dam Mag, by Morgan Tiger (Dike's); g d Fan, pedigree not traced. Bred by Abraham T. Putman, De Peyster, N. Y.; passed to Charles E. Putman, Ogdensburg, N. Y., then to Frank Jones, Portsmouth, N. H., then to Hiram Howard, Providence, R. I. [Vol. XII.]

MAGO B., ch m foaled 1890; by Birthright 14170; dam Bird (sister to Sultan, 2:38½) by Young Messenger (Davis'), son of Dan; g d Duck, by Good Ike, g g d Bounce, by Marion Preceptor, g g g d a milk white mare of Spanish blood. Bred by W. H. Davis, passed to N. Bartholomew, Des Moines, Iowa. [Vol. XII.]

MOLLY WILLIAMS, b m foaled 1882; by Truman Allen 7413; dam Williams mare, pedigree not traced. Bred by Dennis Williams, passed to W. C. Farnum, Wellsville, N. Y. [Vol. XII.]

RECORD OF OFFICIAL TRANSFERS.

NOTE.—When registered animals change owners the transfer may be recorded here and will be carried into the next volume of the Register, thus maintaining the identity of the animal with the new ownership. The fee is twenty-five cents.

ABBADONNE, (6) b m foaled 1889; by Wilkes Boy 3803; dam Lulu Patchen (dam of Mary Caldwell 2:26½) by Tom Patchen 3996, etc. [See Vol. XI.] Passed to J. C. Easton, La Crosse, Wis.

ACHILZAR 16542, (6) b h foaled 1891; by Alcazar 5102; dam Bessie Paige, by Achilles 2535, etc. [See Vol. XI.] Passed to Fred Pabst, Jr., Milwaukee, Wis.

ACTION, (6) ch m foaled 1888; by Onward 1411; dam Sahara, by Challenger 1064, etc. [See Vol. VIII.] Passed to Thomas F. Miller, Fullerton, Neb.

AGGIE, (7) b m foaled 1889; by Alphington 5702; dam Kitty Woodruff, by Jim Fisk 1726, etc. [See Vols. VIII and XI.] Passed to John Lind, New Ulm, Minn.

Digitized by Google

AGGIE ARTHURTON, (7) b m foaled 1887; by Arthurton 365; dam Plain Agnes, by Mambrino Star 585, etc. [See Vol. IX.] Passed to Thomas H. Bagnell, Marshall, Mo., February 6, 1892.

AIMEE, (7) ch m foaled 1877; by Stillson 670; dam Delilla, by Ashland 47, etc. [See Vol. IV.] Passed to Charles E. Butler; then to E. O. Fretwell, Paris, Ky.; then to F. H. Russ, Hollidaysburg, Pa.

ALCOLA, (6) bl m foaled 1889; by Mambrino Wilkes 6083; dam Lucy E., by Black Walnut 17361, etc. [See Vol. XI.] Passed to George W. Ford, Santa Ana, Cal.

ALICE B., (7) b m foaled 1883; by Souvenir 1549; dam Sorrel Bess, by Harry Glenn 4385, etc. [See Vol. VII.] Passed to E. J. Evans, Osceola, Iowa.

ALLEN HERR 7313, (6) ch h foaled 1886; by Doctor Herr 450; dam Molly (dam of Joe Davis 2:17¾), by Mambrino Pilot Jr. 4729, etc. [See Vol. VII.] Passed to Gray Bros., Cottonwood Falls, Kan., May, 1889, then to A. H. Gray, Emporia, Kan., January 1, 1892.

ANDERSONIAN 18842, (6) b h foaled 1890; by Anderson Wilkes 4197; dam Irene, by Durango 1115, etc. [See Vol. XI.] Passed to A. G. Danforth, Washington, Ill., February 10, 1892.

ANNA Z., (6) b m foaled 1888; by Zumbro 6235; dam Martha, by Abdallah 17711, etc. [See Vol. IX.] Passed to George Weber, Rochester, Minn.

ANNIE JACKSON, (6) br m foaled 1886; by Red Wilkes 1749; dam Miss Patchen, by Mambrino Patchen 58, etc. [See Vol. VIII.] Passed to W. C. France & Sons, Lexington, Ky., then to Marcus Daly, Hamilton, Mont.

WALLACE'S MONTHLY.

VOL. XVIII. FEBRUARY, 1893. No. 12.

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

THE JEWETT FARM AND HORSES.

PROMINENT among the great breeding establishments of the Empire state, is the Jewett Farm, located at Jewettville, Erie county, sixteen miles southeast of Buffalo. The equipment of the farm, including buildings and tracks, is second to none, and includes the only covered mile track in the world, a graphic description of which will be found on another page of this issue of the monthly. The breeding department of the farm has this season been moved to Cheney, Sedgwick county, Kan., where the high-bred trotting sires and matrons will be located, and the parent farm at Jewettville devoted to the training and development of their produce, with the advantage of a first-class track on any day of the year irrespective of changes of weather or temperature. The proprietor of the Jewett farm is among those breeders appreciate that in order to successfully compete for public patronage a breeder of light-harness horses must demonstrate that his stallions are not only well bred and themselves possessed of natural or developed speed, but that they are capable of producing extreme speed, and that at an early age; consequently the colts and fillies bred and owned at Jewettville have been carefully handled and developed during the past two years, and with remarkable success.

In 1891 the stallions owned by the farm contributed twenty-two new performers to the 2:30 list sired as follows: by Jerome Eddy 8, Erie Wilkes 3, Coronet 2, Fieldmont 1, Patchen Wilkes 2, Sherman 3, Rochester 2 and Homer 1. This list includes Rollo, 2:28½ (p), the first yearling bred and developed east of California to beat 2:30; Turco, two years, 2:21½ (p); Corneto, three years, 2:22½ (p); Sherbet, three years, 2:30, and Octo, three years, 2:30. No breeding establishment, except Palo Alto, had ever put so many performers of its own breeding in the 2:30 list in one season, and that the records were largely made in contested races is shown by the following table of winnings of the get of Jewett Farm stallions for 1891:

Number of first moneys won	40
Number of second moneys won	25
Number of third moneys won	13
Number of fourth moneys won	9
Total am't of money won during the season	$10,272.07

During the past season this remarkable showing was continued as shown by the table on the next page, which has been carefully compiled from the Jewett Farm Books.

The stallions which have been transferred to the Kansas Farm at Cheney are Patchen Wilkes, Jerome Eddy, Bonnie Boy, Sherman, Erie Wilkes and Damo, and a brief resume of their pedigrees, with turf and stud performances, will show what an immense acquisition they are to the list of Western trotting sires.

Patchen Wilkes 3550, record 2:29½, was foaled 1882, by George Wilkes 519; dam Kitty Patchen (dam also of Georgiana, 2:26¼), by Mambrino Patchen 58; 2d dam Betty Brown (dam of Wilkes Boy, 2:24½ and Anglin, 2:27½), also by Mambrino Patchen 58; 3d dam Pickles, by Mambrino Chief 11; 4th dam by Brown's Bellfounder; 5th dam by Grey Eagle. A developed horse himself, sired by the great George Wilkes, 2:22; his first and second dams in the great brood-mare list, and both by the greatest of brood-mare sires, Mambrino Patchen 58; it is by right of royal inheritance that Patchen Wilkes at ten years of age

Digitized by Google

is sire of four in the 2:20 list and nine in the 2:30 list, his roll of honor to the close of 1892 being Divan (3 yrs), 2:15¼ (p); Lissa (4 yrs), 2:17; Henrico (3 yrs), 2:17¾; Favora, 2:19½; Blacksie, 2:20½; Westbrook, 2:23; Monita, 2:26¼; Corna, 2:29¼, and Juliana, 2:30.

Patchen Wilkes is of the great Wilkes-Mambrino Patchen cross, that which produced Guy Wilkes, 2:15¼, sire of thirty-one 2:30 performers; Alcantara, 2:23, sire of fifty-one 2:30 performers; Alcyone, 2:27, sire of thirty-two; Simmons, 2:28, sire of twenty-nine; Wilkes Boy, 2:24½, sire of eighteen; Baron Wilkes, 2:18, sire of seventeen; William L., sire of Axtell, 2:12, and two others better than 2:25, and Jersey Wilkes, sire of seven 2:30 performers.

All of these successful sires have produced extreme speed, having from two to twelve representatives in the 2:20 list, and in this respect Patchen Wilkes leads all the sons of George Wilkes, having four 2:20 performers at ten years of age. The next in this respect being Guy Wilkes, 2:15¼, and Gambetta Wilkes, 2:22½, they having each sired three 2:20 performers at ten years.

Individually Patchen Wilkes is a magnificent horse, high finished and clean cut in conformation, jet black in color, with a dash of white in face and hind ankles white, sixteen hands high; a perfect type of the American trotting horse.

Jerome Eddy 1260, record 2:16½, is the next horse on the list. By Louis Napoleon 207, sire of fifteen in the 2:30 list; dam, Fanny Mapes (dam also of Edmore, 2:29¼, and of six producing sons), by Alexander's Abdallah 15; 2d dam, Smith Mare, by Burrs Napoleon; 3d dam, Brook's Mare, by L. I. Black Hawk, 24; 4th dam, Fox Mare, by imp. Trustee; this horse is at once excellently well bred, a developed trotter with a fast race record, and a successful sire. He has seventeen 2:30 performers to his credit as follows: Lizziemont, 2:16¾ (p); Fanny Wilcox, 2:19¼; May Eddy, 2:22½ (p) and 2:25½ trotting; Bertrina, 2:23;

Digitized by Google

Stelletta (2), 2:25 (p); Edina, 2:25¼; Dick Eddy, 2:25¼; Metamora, 2:26; Viotta (1), 2:27 (p); Tyco, 2:28¼; Fraro, 2:28¼ (p); Edifice, 2:28½; Rollo (1), 2:28½ (p); Adora, 2:28½; Arlino, 2:29½; Lorella, 2:30, and Octo, 2:30. It should be noted that this list includes two yearlings, Viotta and Rollo, with records better than 2:30, and that Jerome Eddy is the only stallion east of California that has two of that age in the list. Jerome Eddy is a bay horse with black points, no white marks, 15¾ hands high, and of remarkable power and finish; his superb individuality, grand turf performances, and harmonius trotting inheritance are guarantees that he will continue to maintain a high place among the sires of early and extreme trotting speed.

Sherman, 1506, record 2:23½, is by George Wilkes 519; dam Lady Belmont, by Belmont 64; 2d dam Curd Mare, by St. Lawrence. Sherman is a grand individual, black-brown in color, sixteen hands high, and is fast making a stud record that promises to place him among the prominent sires of the great Wilkes family. His 2:30 performers to the close of 1892 are: Ashman, 2:18¼; Helio, 2:20½; George Sherman, 2:24¼ (p); Ashmaid, 2:25¼ (p); Zyco, 2:26¼, and Sherbet (3), 2:30.

Erie Wilkes 3610, record 2:31½, is a bay horse foaled 1882, by George Wilkes, 519; dam Traitress, by Confederate Chief 423; 2d dam by Topgallant, son of Hambletonian 10. He is sire of Turko (2), 2:21¼ (p); of Carro 2:24¾ (p), and of Prince Erie 2:29½ (p).

The other stallions mentioned, Bonnie Boy and Damo, were bred and raised at the Jewett Farm. Bonnie Boy 6401, black horse foaled 1886, is sired by Patchen Wilkes 3550; dam Bonnie Maid, by Sherman 1506; 2d dam Bonnie Lassie (dam of Titania, 2:27), by C. J. Wells 2244; 3d dam O'Brien Mare (dam of Byron, 2:25½.) At six years old he is sire of Bonnie Bell (2), 2:18¼ (p), also of Ninnescah, 2:42 as a yearling. Damo 4366, bay horse foaled 1885, is by Jerome Eddy 1260; dam Bessie Gilpin (dam of Favora, 2:19½), by John Gilpin 1253; 2d dam by Hamlin Patchen 3519; 3d dam by Arabian Morgan; with limited opportunities in the stud, his progeny possess marked individuality and trotting characteristics, and at seven years of age he has to his credit Blue Stem, record 2:26 at three years of age.

The brood mares of the Jewett Farm are among the best in the United States. They rank high in fashionable breeding and as successful stud matrons measured by the performances of their sons and daughters; mated with the great stallions above referred to, the breeding department of the Jewett Farm, at Cheney, Kan., can not fail to continue the remarkable success that has been attained at the original establishment at Jewettville, Erie county, N. Y.

TROTTING HORSE HISTORY.

As Presented in the Christmas Contribution of Mr. John H. Wallace.

BY S. T. H.

If the rare volume of the Elder D'Israch on the "Curiosities of Literature" had been presented for the first time to the reading world in the current year, this apparent valedictory of Mr. Wallace, at least in excerpts, would form an interesting chapter. The indelicate belaboring of contemporaneous turf writers would not be the main feature of their literary curiosity; for historians in all departments have thus marred the context of their own life-work by similar exhibitions of human weakness. The radical inconsistencies of our historian himself make the curiosities of this production all the more anomalous.

In the year that Mr. Wallace first began his labors as the compiler of pedigrees, he was devoted to the publication of an American Thoroughbred Stud Book, and placed himself on record, there and then, as a believer in thorough-

Digitized by Google

bred blood to intensify both the speed and stamina of the trotting horse. This conclusion, like all of his subsequent determinations, was proclaimed to be unalterably founded upon the law of inheritance, because the thoroughbred was absolutely the superior of all other horses in combined speed and endurance. With an equivocation, worthy of no fair cause, he repudiates this proposition in the Christmas curiosity by saying: "This "whole claim that the thoroughbred horse "is possessed of greater endurance than "any other type of horse has no founda-"tion in fact, either in this country or "any other. In the great international "test between Austria and Germany, the "past season, the nondescript Hunga-"rian horses proved themselves the more "enduring, while the English thorough-"bred was *nowhere!*"

The tests of *combined speed and endurance* has been made between thoroughbreds and nondescripts without number, and always to the disparagement of the mongrel bred. Indeed, all English authorities, as voiced by Stonehenge, have shown that when there is a cold cross, even though it be remote, in an English sire or dam, the produce will be deficient, generally in staying qualities. The speed may be phenomenal, but the lack of endurance, especially at a close finish, invariably proclaims the defective outcross.

Within the span of a few years the avocation of Mr. Wallace changed from that of being a compiler of thoroughbred pedigrees to the authorship of trotting-horse fiction, and trotting-horse history. With the change of occupation came a material transformation in his views as to the origin and methods of producing, with more certainty and a larger percentage of success, the swift trotting horse.

In the introductory essay to the first volume of Wallace's American Trotting Register, published in 1871, he thus presents his change of front, the modification showing the beginning of his remarkable crusade against the thoroughbred horse, as the source, or even the collateral aid to the formation and perfection of the American trotting horse, the virulence of which amounts to a mad literary curiosity. On page 15 he proclaims: "We are indebted, *after all*, "to the thoroughbred for the trotter, but "this debt is substantially limited to a "*single family of thoroughbreds or the* "*descendants of one single horse.*" This family, as the general reader is well aware, is that of imported Messenger. In the subsequent pages of that able paper he traces the lineage of Messenger, showing that his sire, the English Mambrino, "was one of the most famous race "horses of his day, in all of his contests "being beaten but four times. But," he continues, "it is not his running, but "his road and trotting qualities we are "to consider." In 'Whyte's History of "the British Turf' the following lan-"guage occurs:

"Mambrino was likewise sire of a great "many excellent hunters and strong, "useful road horses. * * * Lord "Grosvenor offered to bet a thousand "guineas that Mambrino could trot four-"teen miles in the hour. * * * He "was a race horse and got race horses. "He was a *natural trotter* and got *nat-*"*ural trotters.* * * * There can be no "doubt he (Messenger) inherited from "his illustrious sire (Mambrino) the "great road and trotting qualities which "he perpetuated in his descendants."

Thus, it is definitely concluded, *to the satisfaction of Mr. Wallace*, that Mambrino was a natural trotter, although a pure-bred running horse. "His sire, "Engineer," he admits "had nothing in "his history that connected him in any "way with the trotter, except that he "was the sire of Mambrino;" nor can he trace the habit of pronounced trotting action in his grandsire—the thoroughbred Sampson.

Thus, the fountain source of the fast trotting action is located in the English Mambrino. "He was a *natural* trotter "and got *natural* trotters," and "there "can be *no doubt* that Messenger in-"herited from his illustrious sire (Mam-"brino) the great road and trotting qual-"ities which he (Messenger) perpetuated "in his descendants."

This conviction was not a passing emotion, for he is so positive that this natural trotting inheritance was the controlling instinct of Messenger that, on pages 50–1 of the second volume of Wal-

Digitized by Google

lace's Trotting Register, published in 1884, he says:

"In my essay in volume 1 I assert "that the only daughter of English "Mambrino brought to this country was "Mambrina in South Carolina, but I "find that I omitted another daughter "named Ruth. She was elegantly bred, "and if the descendants of Messenger "had been bred with those of his half "sisters, Ruth and Mambrina, *we might "have had to-day a horse to go in 2:10, "with a pedigree as pure and authentic "as that of Enquirer or Harry Bassett!*" No other thoroughbred enthusiast has ever dreamed of producing a thoroughbred trotter as pure in lineage as the son of Longfellow.

This, indeed, would have been a race of thoroughbred trotters in a double sense. Had it been evolved, Mr. Wallace would have proven the altogether competent and peerless prophet in the whole range of trotting literature. But other thoroughbreds have since so kindly commingled in trotting pedigrees, including the families of Lexington, and Australian, and Hercules, and Belmont, and of many others, that the accumulating statistics, showing the inaccuracy of his wildly prophetic predictions, that the trotting evolution was confined by the records to the single family of English Mambrino and his descendants, demanded an attack, not only upon the purity of many of these thoroughbred infusions into trotting pedigrees, but upon the integrity of Messenger himself, as a pure-blood horse. Although Messenger ran as such, was sold as such, made twenty seasons in America as such, and produced first-class race horses as such, which could not have been possible had he been a mongrel-bred horse, yet Mr. Wallace thus insinuates, at this late day. He says in his Christmas paper:

"I do not believe that she (Mes-"senger's dam) was bred as repre-"sented. As confirmatory of this view "we have a great mass of facts going "to show that Messenger, *from his own "loins, and in his own right, founded a "great tribe of trotters; something that no "other English race horse ever even com-"menced to accomplish*, in that or any "other generation. It follows, then, "that Messenger had an inheritance "that no English race horse possessed, "and this inheritance enabled him to "transmit what no other English race "horse had the power to transmit."

Stamping Messenger thus, as mongrel bred, without the least scintilla of evidence, was done to pave the way for the injection of a base outcross to which the trotting inheritance could be attributed, thereby robbing even English Mambrino, whose pedigree must necessarily be attacked, in pursuance of the credit given him of being a "*natural trotter* who begot *natural trotters*:"

This cold-blooded outcross is gravely suggested in these words: "From all the "conditions of the problem, I do not "hesitate to express the belief that "*Messenger himself inherited some of the "speedy blood of the English pacer.* "This *may* have come through his fast "trotting sire, or it may have come "through his dam, *or both.* If this theory "of the case be correct, we have the old "English pacer, *as the one source*, from "which has come the American trotting "horse!"

Thus has the apostle of "trotting instinct," the latter-day expounder of the "*Historical* Sources of the Trotting Gait, as Shown by Exhaustive Research," sought to rob the English Mambrino of the purity of his lineage, because of the phenomenal speed of his trotting action and his power to transmit the same with increasing potency through his son Messenger, simply to gratify his antipathy to the peerless blood horse, and to confer the wondrous gift of his trotting inheritance to a nondescript mongrel pacer, whose existence, either as an individual or as the member of a family, has been evolved solely out of his own imagination, without enough authentic data upon which to found the semblance of a modern historical fiction. Here is a revelation in trotting-horse history that fell still-born from his mental womb.

The trotting potency of Messenger derived from the old English pacer! And, moreover, this pacing infusion came either through his sire or his dam—"Wonderful Research"—as marvelous

Digitized by Google

as it is "Exhaustive." The English Mambrino a mongrel?

From Wallace in *Clark's Horse Review* we appeal to Wallace on page 21, volume 1, of The American Trotting Register: "Mambrino was one of the most famous "race horses of his day. * * * Thus "there was produced in England, a hun-"dred years ago, a horse of the highest and "purest lineage, that stood at the head "of the turf, till he was ten or eleven "years old, carrying weights that would "crush the life out of most of our modern "race horses, and never was beaten but "four times. He went into the stud and "perpetuated his triumphs in a long and "illustrious list of winners." In the wide range of turf literature has a mongrel-bred horse ever become so peerless a race horse, and so distinguished a sire of race horses? To what unblushing subterfuges has the gangrene of the veteran turf writer, thus resorted, against the blood horse, solely because of his powerful contributions to the speed and endurance and quality of the trotting horse? It would be charitable to attribute this pitiable exhibition to the pardonable prejudices of senility, had it not been the animus of the writings of his prime.

Messenger's trotting potency inherited from the English pacer! What, according to this solitary historian of the existence of such a breed, was the English pacer?

He thus presents his feeble citations: "Blundeville, one of the first writers on "the horse, in the English language the "same year that Elizabeth ascended the "throne, thus describes the different "breeds of horses of his day: 'Some "have a breed of greate horses meete for "war. Others breed *ambling* horses, *of* "*a mean stature*, for to journey and to "travel by the way—some, again, a "race of swift runners to runne for "wagers, but plaine countrymen will "have a breed only for draft or burden.'" After the word "*ambling*" Mr. Wallace injects (*pacers*) in brackets, but it does not follow that the ambling or saddle tackey means the pacing horse. Indeed the majority of trotting horses amble, but never pace. Granted the strained inference, can it be possible that the mighty race horse, Mambrino, or his great son, Messenger, derived their phenomenal trotting potency from the doubtful existence of the "mean-statured amblers" of the days of Queen Elizabeth?

Mr. Wallace claims that "the poor little "pacer, at the time of the Restoration "was undersized, was not profitable and "*was met and submerged by a wave of* "*blood from the desert* that was never "known to pace. * * * Further-"more, he admits that for more than a "hundred years no Englishman has ever "seen a pacer unless it was in some for-"eign country."

Messenger was foaled in 1780. The pacer, if he ever had a family existence, in England, according to Mr. Wallace, became extinct soon after the restoration of Charles II., who was born in 1630 and died in 1685, nearly 100 years before the birth of Messenger. Had the "poor little pacer," the wayside palfrey, such potential heredity as to appear 100 years after his extinction, and dominate the action of the greatest race-horse of his day—the English Mambrino? None of his ancestors ever paced so far as the record shows. Heredity is a subtle inheritance. It may disappear in one or two generations and then mysteriously appear with renewed power. But after it has become *extinct*, it certainly has not enough vitality to rise more than phœnix like in vitality out of absolute nothingness, and dominate the brain and action of a more powerful, living, active and constantly intensifying inheritance, such as the galloping heredity and conformation of the English thoroughbred. Mr. Wallace says the inferior race-horse of the desert met and completely submerged the little pacer and his pacing habit. Is it possible that one hundred years after this extermination he could still have capacity in his grave to meet and submerge the superior English race horse?

When we remember the bold, defiant fearlessness of Mr. Wallace as an investigator in his prime, and compare it now with the miserable subterfuges to which he resorts in this Christmas paper, we can not refrain from commiserating his palpable sapping of the foundations of the vast and splendid monument he had built to his name as an impartial student

Digitized by Google

of the trotting problem in former years. The pacer is a curious study. He has appeared wherever the saddle horse is needed in new countries. He can be made out of any breed by mechanical manipulation. In Kentucky it matters not whether it be the cold-blooded horse used to drive cattle, or the descendants of the higher bred Drennon, or of the still richer bred Denmark, tracing directly to Imported Hedgeford; if he is ridden on the hard highways, barefooted in front and heavily shod behind, and manipulated with a curb bit, he will change his trot or gallop into an amble and from that he will break into a pace. In the first generation this action may thus be the result of mechanical manipulation, but, within a few generations, the pacing action becomes a confirmed inheritance. Highly bred trotters have been thus converted to the pacing action, and pacers have been converted to the trotting movement by the reverse method of weighting the front feet. In the admixture of lineage the trotting-bred descendant may become a pacer, but pacing lineage generally appears in the remote crosses. But, however, anomalous may be the appearance of the pacing action, one fact is apparent, that nowhere upon the face of the earth are to be found large tribes of natural pacers. Nor has the domesticated pacer the power to enlarge his tribe to any great extent. The Tom Hal family seems to be the most consistent exception to this rule. But the extinction of the mythical pacer of England and of the less shadowy Narragansett pacer, and of the more modern Tom Crowders and Tuckahoes and Capt. Walkers, and even the gradual fading away of the more cultivated Legal Tenders and Blue Bulls prove that, in the last analysis, the pace is the accidental or manufactured action which becomes merged into the more dominant movement of the trot. Perpetuity is the test of both the strength and naturalness of action. In the purview of these facts, the pace is beyond a peradventure the weakest of all the actions of the horse. All horses, walk, trot and gallop. Very few horses pace, as the intermediate gait, and these few have very little capacity to uniformly perpetuate this exceptional action. For this reason pacing stallions beget more trotters than pacers, and these, in turn, even though they be the descendants of old black Pacing Pilot, or of the phenomenal Blue Bull, produce a still larger percentage of trotters than did their ancestors. Thus the pacer is in a constantly diminishing ratio of perpetuation. How a tribe with such a feeble potentiality could appear from the grave after it had been buried for a century and pervert the heredity of the peerless English race horse—the very perfection of form and action and inheritance—is one of the strangely curious propositions that scientist would not entertain as the emanation of a serious enquirer.

But the other horn of this dilemma is more troublesome to Mr. Wallace than the one he attempts to thrust into the vitals of the thoroughbred horse.

If the pacer has the power, either through his daughter or through a dam *that has a taint of pacing blood so faint that it can not be traced*, to completely submerge the running instinct, then Mr. Wallace has discovered a ready method of producing trotters, both in action and heredity. All that the breeder has to do would be to infuse into the progeny of a thoroughbred horse a pacing cross on the side of the dam, and, behold! with the magic of the prestidigitator, he has an English Mambrino, or his more prepotent son, Messenger. This proposition is not novel among the vagaries of the breeding problem. The late Col. Richard Anderson, whose name is connected with the breeding of Pilot Jr., made this attempt on quite an extensive scale. He owned Gipsey Queen, pacing record 2:24, and two other fast pacers, that he bred to Imported Hurrah and Bonnie Scotland for several seasons. These mares had the developed pacing inheritance; but the progeny could neither run nor trot, nor pace with any promise of speed, after they had been trained, and the attempt was abandoned as impractical. It can not be said that these sires had no trotting action, for both of them were gifted at that gait, and Bonnie Scotland sired Scotland, trotting record 2:22½, out of the famous old Pilot Jr. mare Waterwitch, whose

Digitized by Google

dam was also by the pacing horse, Kinkead's St. Lawrence. The thoroughbred blood does commingle powerfully with that of the pacer, but more effectively in the combination of the brood mare than in the sire. Pilot Jr. was the great brood-mare sire of his day. His successful daughters represent every shade of trotting blood, but it is a very significant fact that only from his two daughters, Miss Russell and Midnight, *out of thoroughbred mares*, came the swiftest of the record-breakers that trace to his loins in the first and successive generations.

For many years Mr. Wallace has been in mental anguish to ascertain the true and only source or origin of the American trotting horse. There never was a single source. He is composite in lineage, and his origin must, therefore, be traced to several sources; not a single one. The Barb has directly contributed his quota in the influence of Imp. Grand Bashaw. As early as 1650 the Duke of New Castle, in his rare work, described the Barb as "*possessing a superb and high action. He is an excellent trotter*, and galloper, being remarkably beautiful and active, with plenty of power and excellent wind." Having this characteristic for ages, it is in accordance with the laws of inheritance that from his loins, by judicious training and crossing, should have come the powerful triple trotting family of the Bashaws, and Clays, and Patchens.

The Morgans always possessed a distinctive, high, bold, energetic trotting action, coupled with a level brain, and a resolute ambition to stick to the trot as remarkable as their compact, pony-built formation and strength of vitality. They, too, have contributed valuable traits to the future perfected trotter independently of any Messenger crosses.

The pacers have especially added the valuable material of harness speed to this composite success, and the thoroughbred crosses, immediate and remote, have fortified the trotting evolution from beginning to the present day.

But superior to them all, from the fact that it has absorbed them all, and bids fair to obliterate them all, as independent factors, rises the Messenger supremacy. It is the great gulf stream, and all the others are tributary. *If the pacer had been the pre-eminent element he would have founded the paternal line that caused all other sources to merge into it;* and the same logical conclusion would be germane to the Bashaws, the Morgans, and to all the other sources of the trotting horse. But, as all of these are tributary, not the main stream, the pacer, like all the others, is to be classified among the minor sources—not the major source of the origin of the American trotter.

Now, what reasonable conjecture, much less fact, would lead to the inference that pacing blood ever assisted the trotting capacity of Imported Messenger? Neither Messenger nor any one of his ten notable sons mentioned by Mr. Wallace ever paced themselves—nor did they ever produce pacers. If the pacing leaven was in their veins it would have cropped out in some of their descendants; for this is the invariable result, in more recent times, of an infusion of pacing blood in the modern trotter. This fact alone excludes all conjecture that Messenger had an infusion of pacing blood in his lineage.

In consecutive order it is pertinent to consider the persistent claim of our historian—that he has formulated the laws whose operation has evolved the present perfected state of the trotting horse. He says: "These doctrines were formu-
"lated in great simplicity and clearness
"some eighteen or twenty years ago,
"and which have ever since been pressed
"upon the breeding public with what-
"ever vigor I possessed."

It has been the assumption of Mr. Wallace that he formulated (not codified existing well established) laws, which have brought into existence the splendid trotting horse of this country. Unfortunately, for this assumption, all the great heads of the trotting family had not only been foaled, but had made their successful crosses before Mr. Wallace had compiled the first volume of the Trotting Register in 1871. No single breeder or writer ever brought out the conceptions that produced Hambletonian 10, or Andrew Jackson, or Pilot Jr. No single mind ever figured out the

value of the Hambletonian and American Star cross, in the first instance, and the Hambletonian and Clay cross in the second; nor of Wilkes with Mambrino Patchen mares, and all the other successful combinations. It required no profound philosophical insight to conclude that "like produces like"—which had been the foundation law of breeding long before the American trotter was in process of formation. The greater ability has been displayed by those who have made successful outcrosses which have added to either the speed, conformation, or endurance of the breed.

Another eccentricity of our historian, to stamp it with no graver charge, is that of utterly ignoring any other contribution of Imp. Bellfounder to the organization of Hambletonian 10, than that of assuaging the willful temperament of the Abdallah family:

"The central figure," he says, "in "this (Hambletonian 10) pedigree is the "mare One Eye, and we think she was "the leading factor in the grand results "that have been developed in the de-"scendants of her grandson." Thus the Bellfounder cross in his dam, the famous Chas. Kent mare, by Imp. Bellfounder, is totally ignored. He further adds:

"There is no use in blinking the mat-"ter. The Bellfounders were dead fail-"ures as trotters, and not one of them "could trot even 'a little bit' unless he "was backed up by Messenger blood."

"*Whatever the measure of her* (the "Kent mare) *development, she had some-"thing to transmit that she did not in-"herit from her sire.*"

There could be no greater perversion of trotting turf history than is contained in these spiteful sentences.

The Charles Kent mare was bred by Jonas Seely, Orange county, N. Y. foaled in 1833, and, according to Orange County Breeder, in the "Spirit of the Times" for April, 1865, "she was noted "as a fast and lasting road mare. She "was never trained, but I saw Peter "Seely ride her, as a four-year old, two "trials in 2:43 and 2:41 on the Union "course." Now, did she derive this great trotting capacity from her dam One Eye, of doubled Messenger inheritance through her sire Hambletonian, the son of Messenger, and her dam by Imp. Messenger himself, or did she receive a positive trotting inheritance, also, from her sire Imp. Bellfounder?

In a late series of articles the venerable John Minchin describes the "Charles Kent mare" as a faithful reproduction of her sire in both formation, action and temperament. He personally knew both sire and dam. Bellfounder was imported because he was a trotter. Messenger was imported, not because he was a trotter, but a galloper, the son of the greatest racing horse in England.

James Boott, a wealthy retired merchant of Boston, came from England and imported, through his brother, then living near Norfolk, England, the home of English road horses, the trotting horse Bellfounder, in 1822. Col. Samuel Jaques, Jr., another retired Boston merchant who devoted his later years to stock raising, farmed Bellfounder from 1822 to 1828 at $500 per annum. He was claimed to be capable of trotting seventeen miles within the hour. Whether this, like the claim for the English Mambrino, by Lord Grosvenor, was an exaggeration or not, Bellfounder was noted in this country as a remarkable trotting horse.

William Jaques, the son of Col. Samuel Jaques, Jr., says:

"I rode Bellfounder many times and "always found him level-headed and "gentle as a lamb."

"He could trot in three minutes with "perfect ease, and keep it up for miles. "Once I led him by the side of a running "horse for fifteen miles without Bell-"founder leaving his feet."

The late Mr. Alden Goldsmith thus furnished his personal knowledge of Imp. Bellfounder: "He was a blood "bay, with a strong, bony head, neck "well formed, shoulders very strong, "body round, *with immensely strong "quarters,* and a large, bushy tail. "When brought out to exhibit his speed, "he seemed full of game and mettle, *but "very controllable.* His knee action was "very attractive and high. When Obid "—his groom—would get upon his bare "back and give him his head, *I remem-"ber of but one horse that could approxi-"mate to him in speed, this way rigged,*

Digitized by Google

"*which was the famous George M.*
"*Patchen.*"

"Bellfounder was remarkably honest.
"I have seen him exhibited at full speed,
"a number of times. I never saw him
"leave his feet. Hambletonian's dam
"was by this great horse, and her speed,
"at four years old, was very great, sel-
"dom equaled in even these fast times."

This living testimony of eye witnesses shows that Bellfounder was the very best trotting stallion of his day, superior as a trotter to Abdallah himself, when speed and temperament are taken into consideration with power and action. Is it possible that such a superb horse contributed nothing to the trotting inheritance and capacity of the famous Charles Kent mare? Her dam, Mr. Wallace says, could trot in 2:52, while she herself trotted a repeat mile in 2:41. Is it possible that this increase of speed received no momentum from her celebrated trotting sire? If Mr. Wallace answers nay, every other impartial investigator and reader will respond to the contrary. Having thus presented the positive trotting contribution of Bellfounder to the Charles Kent mare, the concluding enquiry would be: "How much did he contribute to her formation which reappears in her son Hambletonian?"

The late Mr. T. T. Kissam, one of the eminent trotting horsemen of his day, thus describes, from personal observation, both Abdallah, and Imported Bellfounder:

"Abdallah was flat ribbed, short in the
"flank, roach backed, hip and loins of
"medium breadth, *peaked from hip to*
"*set on of tail, which was very thin*
"*haired,* long from hip to hock, rather
"thin quarters, and short to fetlock,
"without any marks."

"Imported Bellfounder had a small
"head and ears, full prominent eyes,
"wide apart, neck medium length, well
"set up from the withers; shoulders deep
"and oblique; full chested and deep
"girth, fore-legs well apart; short back,
"round ribbed, and very broad on the
"loin; hips wide and well gathered in;
"long, full quarter to hocks; limbs
"strong and well-muscled, with tail and
"mane full haired."

Now, when Hambletonian had grown to maturity, which one of these ancestors did he resemble? His mane and tail floated abundantly and beautifully like Bellfounder's. His carcass, was full and round like Bellfounder's, not flat ribbed like Abdallah's. His hind quarters were large and powerful, *not peaked from hip to set on of tail,* like his sire's, Abdallah, but swelling up so high and wide, with their wealth of propelling muscles, like those of his dam, the Kent mare, and of her sire Bellfounder, that, at rest, "he looked to be too massive behind to have that supple, bold and commanding movement that marked his trotting action."

This abnormal development of the hind quarters of Bellfounder has given to Rysdyk's Hambletonian, and to his descendants, notably George Wilkes and Electioneer, a type of propelling power in direct contra-distinction to the cat hams of Abdallah.

Moreover, he was not only potent enough thus to modify the hind quarters of the Abdallah, but likewise of the Bashaws. That life-long student of the trotting horse, Hark Comstock, in an able review of the horse stock of Erastus Corning, thus refers to Sayre's Harry Clay, 2:29, whose dam Fan, sister to Crabtree Bellfounder, was, also, sired by Imp. Bellfounder:

"*There is a remarkable similarity of*
"*appearance between the get of Rysdyk's*
"*Hambletonian and of Sayre's Harry*
"*Clay, owing, we infer, to the influence*
"*of the Bellfounder dam in each in-*
"*stance.*"

Green's Bashaw, 2:35, the sire of seventeen standard trotters had this same enormous Bellfounder development in the hind quarters. His dam was by Tom Thumb, who makes no other figure in trotting history, but his grandam was this same Charles Kent mare by Imported Bellfounder. The grandam of Belmont, the sire of Nutwood, the greatest living sire, and of Vatican, and of Wedgewood, and of thirty-five other standard trotters, was Belle Lupe, by Brown's Bellfounder, the best son of Imported Bellfounder.

McCurdy's Hambletonian, the sire of fourteen standard trotters, had the same grandam, while George M. Patchen Jr., 2:27, the sire of ten standard performers, was out of Belle, by Top Bellfounder, the

Digitized by Google

grandson of Imported Bellfounder. Thus this great horse contributed potentially to the brain, the formation and the trotting action of other great sires besides Rysdyk's Hambletonian.

"But," says Mr. Wallace, "the value "of any blood can only be determined by "what it can do of itself. This is a safe "maxim, and will hold good under all "circumstances."

This is the maxim by which these two great sires should be tested. Abdallah sired many sons out of richly-bred Messenger dams. He produced Spaulding's Abdallah out of a daughter of Star Gazer, son of Engineer. He also sired Van Siclen's Abdallah out of the Graham mare by Hickory, grandam by Mambrino. Yet neither one of these thus deeply inbred in Messenger lineage, nor Roe's Abdallah Chief, nor any other one of his sons has ever produced a standard trotter, except Hambletonian 10, out of the Charles Kent mare by Imported Bellfounder.

Is this merely an accident? If the inbred Messenger produce of Abdallah were all failures, and the Bellfounder outcross son the splendid exception, which was the more potent combination? But to relieve the enquiry of the slightest doubt, it may be added that Abdallah begot three standard performers, two of which are out of unknown mares, *but the third, with the fastest* record of the trio; Sir Walter, 2:27, is out of Jen, by King's Bellfounder, son of imported Bellfounder.

These citations and this review succinctly present the inaccuracy of the deductions of our historian contained in his Christmas curiosity.

When he refers to so able a jurist and so impartial a turf writer as Judge M. W. Oliver, as a "quibbler"—and to the equally learned and reliable "Hark Comstock" as a "brainless wiseacre," simply because they reject, as unsupported, his "doctrines" and "theories" relating to the trotting and the pacing horse, he merely continues the stream of personal vituperation by which he vainly endeavors to submerge the decrees of the Register Association, relating to the pedigrees of Pilot Jr. and Sunol, as "the decisions of Woodburn," and a "*miserable shame upon the truth, most humiliating to the name of Wallace.*"

It is only necessary to add that such invective injured but one single character, and the reading public do not require the punctuation of his name.

THE TROTTING STRIDE.

EDITOR WALLACE'S MONTHLY,

DEAR SIR:—Some men are color-blind, others can not distinguish one tune from another, and instances are frequent where a faculty common to a large proportion of the human race is entirely lacking in a few. This is so well known that it would be a waste of time to offer illustrations.

That "S. T. H." has not the faculty to comprehend the action of either gallopers or trotters is the only explanation I can offer for the errors in his communications and which he refuses to correct under circumstances which anyone who had the faculty in even a limited degree, would readily appreciate. He reiterates that a trotting horse at speed will show the hind footprints in the same mark as the fore feet left. To use his own words: "Still a third class of experts affirm that the stride is balanced only when the hind footprints drop into the front ones." Although he qualifies in the next sentence thus: "All these assertions are measureably correct, but no one is exhaustive of the subject." There was no such reservation in his first article. In that, commenting on the action of the "beautifully gaited veteran Schuyball," he writes: "He *walks and jogs and trots precisely in the same footprints.* His action, therefore is perfectly balanced." The italics are copied from S. T. H. as he has a fondness for emphasizing in that way.

To prove, however, that S. T. H., gifted though he is in other respects, did not comprehend the action of race horses I will quote from what he wrote more than twenty-five years ago, and as he is just as far wrong in regard to trotting action, it is a fair inference that it is a

Digitized by Google

congenital lack on a par with color-blindness, etc. The quotation is from Wilkes *Spirit of the Times*, February 9, 1867, the caption of the article from which it is copied "The Highest Form of Trotters—Reply to Iowa Breeder," and signed "S. T. H." "In conclusion, permit me to explain why, in my judgment the outward form of the finished throughbred is materially different from that of the perfect trotter.

"The thoroughbred, in his motion imitates the English hare or the American deer. The two fore feet descend together and the two hind feet observe the same law. The weight of the body is thus sustained, at one instant in full motion by both of the hind legs together, and at the next instant by both of the fore legs." He took that as a basis to prove that the strain on the legs of a trotter was double that which was thrown on the limbs of the racehorse. But I will not emulate S. T. H.'s methods in misrepresenting what has been written by his opponent in a controversy, giving enough of his own language to show the position he assumes. His last article in the MONTHLY does not touch on the merits of the question, he charges me with utterances which do not appear; attempts to answer with a jumble of words which under no construction can be termed arguments. I endeavored to correct the false position as gently as possible, as there was no desire to parade a more accurate knowledge of the trotting stride, the whole aim being to remedy the false teachings, in as important a question as that under discussion, for the benefit of those who might be misled by the positive statements.

Its importance will be granted by everyone who has given attention to the education of fast trotters, and though this particular phase or branch of the teachings has not, in the past, been fully understood there is little fear of it being passed over in the future. By analyzing the stride, comparing that of the horse which has faulty action with that of an animal which is nearly faultless, deficiencies may be overcome, rectifications made. It is only the lack of comprehension of the subject which contains anything I have written to warrant the conclusion that the stride can not be modified, and all the Latin quotations, italicized sentences, and an unwearying jargon of words will fail to convince a person who is not action-blind. I need only to refer to the articles heretofore printed to carry this point. A paragraph from the last communication of S. T. H. reads:

"He claims the footprints of his 'young mare of great length of body and limbs,' prove that she has a stride of only *eight feet ten inches in a jog, and fifteen feet at a 2:50 gait!*" Italics and exclamation point are amendments of S. T. H. He goes on to state, "She is a trotting phenomenon." Again I will say, that to a person who had paid attention to trotting action and with a fair capacity to comprehend what was written, explanation would be unnecessary. Readily understood, that an effort was made to have the hind foot fall into the imprint of the fore foot on the same side of the body, and that was troublesome, as it necessitated a rate of speed too slow to call a jog in the common acceptance of the term. But S. T. H. claimed that Schuyball "walks and jogs and trots precisely in the same footprints. His action, therefore, is perfectly balanced." Here is the true "trotting phenomenon," and anyone who will show me his counterpart can take away the "long-legged, long-bodied filly," and ten other horses I own, provided the representative of the "beautifully-gaited veteran" can trot a mile in 3:00. I will add $1,000 in cash if Schuyball be sent here and accomplishes what S. T. H. says he has done, and will allow him a margin of 23½ seconds added to his record, and so soon, Mr. Editor, as you are satisfied that the horse is on his way to California or have the assurance that he will be started to comply with this offer, the money will be placed to your credit for you to pay over as soon as the notification is received that he has repeated that most extraordinary feat in the history of fast trotting action. Two paragraphs in S. T. H.'s communication are so mixed that it is an intricate puzzle to get at his meaning. Here is a part of one paragraph, the opening sentence of which has already been copied: "The reader may measure the strides of any number of trotting horses, not of great or unusual length of

Digitized by Google

body and limbs, but as compact as the average Morgan pony, and very rarely will he find the jogging stride to be as limited as eight feet ten inches, or even twelve feet." But that measurement was obtained to prove that the Schuyball "perfectly balanced action" was only possible at a slow rate of speed, and with a short stride. I have known horses which would jog at a four-minute gait and stride further than the filly when trotting at a 2:50 clip.

Jogging is an indefinite term, and what one driver might call jogging another would denominate strong work. But when one of the conditions is fixed, that being that the hind foot shall fall into the imprint of the fore foot on the same side, there can be no mistake, and though my only trial under that proviso is that published in the November number of the MONTHLY, I will "make it an object" for anyone to show a stride of twelve feet when these conditions are fulfilled. Here is one of the sentences that is so far above my comprehension that if it has a meaning it is hidden so effectually that a guess is all that can be made. "Moreover, let him measure the stride in a walk, and he will be more convinced that the particular mare under consideration is a curiosity." The inference would be that S. T. H. believed that the stride in a walk was in excess of eight feet ten inches, although he is becoming somewhat cautious in his statements. A fast walking horse drops the hind foot in advance of where the fore foot rested, some of them further in front than the trotter that S. T. H. says, in his first article: "When he was urged up to his speed, then the hind feet extended fourteen inches beyond the front feet and then only his trouble began in earnest. Palpably his propulsion was in excess of his carrying capacity." I never measured a walking stride, in which there must be the same variation comparatively, as there is in that of the fast trot and fast gallop. A fast walker is likely to stride further than one a good deal slower, and there are long and short-striders at that gait as well as the others. But in the horse in motion there are several illustrations. "Sharon walking stride 5 feet 6 inches." "Ox walking stride 6 feet," and "Hanling stride 5 feet 9 inches." Sharon was rather a small horse, a "gaited saddle horse," and it may be that a very fast walker will stride 8 feet, but until I make a test will not hazard an opinion.

"When the speed is quickened to a 2:50 gait, he will measure the multiple of average trotters, and still more rarely will he find the stride to be extended when passing from the jog to this rate of speed the one-half of six feet two inches, which "Mademoiselle Portraiture" gained with tips on her front feet. The query arises that at this ratio of increase, how great would be the length of her stride at a 2:20 gait?

Now, to take the Schuyball jog as a factor, and S. T. H. can select any fast trotter with a stride of eighteen feet or upward, and if there is not a difference of eight feet or more between the strides I will "acknowledge the corn." More than that, I will wager S. T. H. or anyone else $100, that if Kremlin be restricted to the Schuyball jog the stride will not measure within nine feet of what is claimed to be his stride at full speed, viz., 19½ feet, the $100 lost to be paid to Bither for making the trial. Unless the arithmetical faculty of S. T. H. is as hopelessly lacking as his comprehension of fast trotting action is now, and that of the fast gallop nearly twenty-six years ago, he could easily "figure out" for himself the increase of length of stride at a 2:20 gait. There is no way of estimating what the short stride would represent from the data afforded by the longer, unless we assume that the same time was given to each. Now, in a very slow jog—the Schuyball jog—the action is not so quick, there being more difference in that respect than 2:50 and 2:20 represent—600 strides in a mile when each is 8 feet 10 inches, and 352 strides in a mile of 15 feet each. If 352 strides give 170 seconds, what will 600 strides give? 290 seconds, within a minute fraction; 4:50 for the mile. The next proportion will be: 170:352:: 140=290 (289.88, to be exact); 290 strides in a mile equal to 17.12 feet each, the length of stride which "M. P." would need to carry, to trot a mile in 2:20,

celerity of action being the same. To make a mile in 2:10 the stride would be lengthened to 19.63 feet, and therefore, if Kremlin strides 19.5 feet his action must be more rapid than that of a horse which goes on a 15-feet stride and trots the mile in 2:50.

Now to put this measurement of trotting strides to practical uses my aim will be to elongate the stride of the filly which S. T. H. has seen fit to christen with a name that does not suit me as well as the one she bears, Altavolo, and if successful can reasonably expect that she will trot fast. Heavy shoes and toe weights are appliances usually recommended to lengthen the stride, but I have known these to fail in some cases. I have a five-year-old, his dam a thoroughbred mare that is "rapid" enough to trot very fast, but is so "short-gaited" that after a good deal of work he is only equal to a mile in about three minutes.

Heavy shoes failed, toe weights still worse, his stride was shorter, with either or both, than when wearing tips, and as a last resort tried galloping him in harness. He is "level headed" and will trot his best at any and all times, but his best is not satisfactory even for the road. He will act as "teaser" without disturbing his equanimity, in fact, would rather trot than run. His gallop, judging from looking at him when galloping, is not faulty in the same respect, and measuring strides on a public track, when my stables are a mile away, is somewhat troublesome. If newly harrowed or scraped there will be so many horses at work on it that it is difficult to distinguish individual footprints, and there are other obstacles in the way, not so serious, however, that they can not be overcome, and hereafter more attention will be given to that part of the curriculum.

Before coming to California I practiced measuring the strides of both race horses and trotters, so frequently that there were few brushes given without applying the tape line, and with private tracks to work upon it was easily done. At the risk of raising the ire of S. T. H. I will copy again from *Horse Portraiture* as the matter written a quarter of a century ago is appropriate when considering trotting action.

"When talking of the footprints, I will mention a custom I always followed when training horses, making myself acquainted with their length of stride, and I often find it useful as a guide to show the reasons why they are not trotting as well as common. For instance, we give Never Mind a trial, and he trots a quarter of a mile in thirty-six seconds. He is working and feeling well. We measure the strides for a hundred yards, and find that they average seventeen feet, with very little difference in the length of any of them. At a subsequent period we speed him the same distance, and find that he has been two seconds longer in accomplishing it. The tapeline shows there has been a falling off of a foot in the distance covered, and this would show that there has been no diminution in his action, as it is fully accounted for in the discrepancy in the stride.

We examine his feet to see if it is pain there which has made him fearful of extending them, and if we can not discover any tangible reason, the foot-tub is called into requisition, he is driven on soft ground, with other precautions that we deem necessary to remove the difficulty. On the other hand, should the stride be as long as formerly, it will be evident that he must have lost some of his quickness of action. Now there are various causes that may have affected him in this particular: Soreness of the muscles, interfering with the celerity of their action; weakness from oversweating, or an insufficiency of feed, though this would be more apparent in a longer trial; too much slow, long-continued jogging, or carrying the walks to an extreme, making him dull, and without the proper animation to take delight, as he should, in bursting off for the brush. Should there have been a change in the shoeing, that might occasion it—and I never have a different shoe placed on a horse, without scrutinizing closely the effect it has on the stride. It may seem a trivial matter to follow a horse with a tape line and note the slightest variation in his stride; but I have been benefited greatly by this plan, and I know that you will oftentimes be able to find out the rea-

Digitized by Google

sons for a falling off in speed, that would have troubled you without this assistance."

All of which I am ready to endorse now excepting the use of the foot-tub. That I discarded several times before throwing it out for good, though it is at least fifteen years ago that the final rejection occurred. Although the practice of measuring the strides of race horses prevailed to a large extent in the old days it is comparatively rare at the present time. As stated in the extract from H. P., there are advantages to be derived which will surely repay the trouble. "Gaiting" the trotting colt is oftentimes the most arduous duty the educator is called upon to perform. When the action is faultless, or nearly so, it is seldom that improvement lags, provided the lessons are of the right kind. As a rule the fast trotters of the present time are more "rapid" than those of the old days, though the longest striders that ever came under my observation were Gloster, Queen of the West, Occident (before he was Dunbar'd), and O'Blennis, each of them exceeding twenty feet. Anteeo one of the short-gaited, and that shortened after shoes were substituted for tips on his fore feet. A large proportion of the Electioneers are rapid-movers, and the fastest of them (Arion for instance) might serve as models to the student of trotting action.

In my experience I have found it easier to quicken the action than to lengthen the stride, one of the most effective aids to give more rapidity of stroke, the rolling-motion shoe. But it would be far beyond the limits of this reply to the "vagaries" of my opponent to specify even a part of the methods in use to lengthen or shorten the stride, and will defer that to a future occasion. Should I be successful in teaching Altavolo so that she will add two feet to her present stride, I will have the utmost confidence in her trotting low down in the teens, and when that is accomplished the methods employed will be of interest to those who are similarily situated. I commenced with her September 9, her work since restricted to occasional brushes, and from the estimated 2:50 gait, when her stride was fifteen feet she has improved to better than a 2:40 gait for a quarter of a mile. The older student might be classed as wanting the faculty of acquiring the fast-trotting action, and there are few who would persist in attempting to correct so hopeless a case; still there are reasons for thinking that that one fault—short, very short stride, arose from circumstances the effect of which can be overcome, and experimenting to me has a fascination which compensates for money, time and labor lost.

He is highly formed, of good size, his dam has a half-brother with a three-year-old record of 2:22½, and which is also a half-brother through the paternal line, to his sire. A "full" sister in blood is the dam of one in the list, and a three-quarter brother has shown quarters in thirty-six seconds, and his trainer says that he can beat 2:30 every day in the week. But near relations which can trot fast—a valuable appendage it is true—are of little benefit when the kinship is not accompanied by like qualities, and if galloping fails to give him a longer stride —well I will try some other plan.

There was an unfortunate break in that kind of exercise. Driving him from the track, to avoid being run over by a locomotive, he was turned so quickly that the cart was upset and he had a merry run of two or three miles. An ankle was slightly sprained, and he has "run out" for the past two months.

And now for another quotation from S. T. H.: "Then her subsequent movements are equally astounding. When she jogged the hind footprints exactly landed in the front ones on the same side; but when the speed was accelerated to 2:50, the stride was not only extended the enormous increase of six feet two inches, but the front feet overlapped the hind ones six inches at every stride, notwithstanding the main propulsion is located in the hind levers."

Were it otherwise than that the writer did not comprehend trotting action, had not the least idea of what the trotting stride is, this could be termed a willful and malicious falsification of my statements.

Turn to page 803 of the November number of the MONTHLY, and the diagrams and accompanying letter press will show how far it is from a true quotation. To those who are not possessed of that number a repetition is necessary:

Digitized by Google

"A young mare with great length of body and limbs, it was difficult to gauge the jog when the hind foot fell exactly in the print made by the fore foot, but this is close enough to show:

Stride 8 feet 10 inches.

* * * * *

Left fore foot.. Left hind foot. — 4 feet 5 inches. — Right fore foot. Right hind foot — 4 feet 5 inches. — Left fore foot.. Left hind foot..

The footprints were not in line, being about as far apart as the feet would be when the mare stood in a natural position. After the measurements of the jogging stride were made she was moved about a three-minute gait and the footprints were more nearly in line and placed thus— the scale one-half of that used in the jog:

Stride 15 feet.

* 3 ft. 6 in. * 4 feet. * 3 ft. 6 in. * 4 feet. *

Left hind.. Right fore. Right hind. Left fore.. Left hind..

It would surely be unnecessary to explain that the stars in the above diagrams represented the footprints, but inasmuch as S. T. H. is so wofully ignorant in all pertaining to the action of horses, it is possible that he did not understand the diagrams. Even then I can not comprehend that in so plainly a marked diagram he should have changed four feet into six inches, though that would prove that his fourteen inches overlapping on the part of the Wilkes horse in his first essay was correct. Then it struck me that he had mixed the two diagrams, but no, he changes the first into the Schuyball movement, by stating: "When she jogged the hind footprints exactly landed into the front ones on the same side." By referring to the diagrams it will be seen how grossly they have been perverted, and the meaning twisted, contorted out of all shape.

JOS. CAIRN SIMPSON.

OAKLAND, December 17, 1892.

PROBLEMS IN BREEDING.

BY A. H.

Heredity.

V.—TRAINING.

* * * * We justly boast
At least superior jockeyship, and claim
The honors of the turf as all our own.—*Cowper.*

IN our table we have divided *training* so as to be considered bodily and mentally. The training of a colt and a youth generally refer respectively, to their physical and mental nature; though in the youth physical training is just as easy, as in the colt mental training is difficult. Exhibitions of athletics by men are just as common as exhibitions of mental operations by horses are rare, in interpretation. In this section we shall confine our remarks to physical or bodily, reserving any allusion to mental training. It is only in reference to the highest animal that the latter can be best considered—as "a sound comparative psychology of the animal kingdom, or even of a few of the higher species, is beyond the present possibilities of science;" though many noteworthy attempts have been made to found such a comparative study.

We have indicated, in the italicized appendix, to this part of the tabular statement, the alternative source of origin of the characters acquired by training: by *imparted* we mean simply such as are acquired by pure teaching, as "breaking;" by *derived* we mean such as are inherited, as "trotting pitch."

Are "All Gaits" Natural?—Certainly as W. E. Hoyle says in his excellent article on the "Horse,"* the subject of the horse's paces is one which has given rise to much controversy. "It has been maintained that horses in a wild state use only the walk and the gallop, the trot and others being the results of education. This question can hardly be considered as settled even now—for the fact that quite young foals have been observed

*Chambers' Encyclopædia, Vol. V.

Digitized by Google

to trot beside their dams is explainable as an instance of heredity."

We can not use opinions to settle theories such as we are discussing. Opinions sometimes bias argument. By doing so to maintain "consistency" some may accept or deny such theories according as they seem to square with particular opinions or design. This, however subtle a method, is not one to commend itself. We have first to settle points in dispute before the facts involved can be accepted.

Hence we must settle, if we can, whether the trot is *natural* or *not*. Darwin said that "a horse is trained to certain paces and the colt inherits similar consensual movements." But this explains nothing to us, in this investigation —because it does not go far enough. It really seems that speed in all forms was, to use the expression of Goethe, "the purpose of nature in the horse." Sir Richard Owen said years ago: "No one can enter the saddling room at Epsom, before the start for the Derby, without feeling that the glossy-coated, proudly-stepping creatures led out before him are the most perfect and beautiful of quadrupeds. As such I believe the horse to have been predestined and prepared for men," this preparation and predestination having been going on and resolved *ages* before man himself had apparently commenced to exist or need such perfection! Yet the quotation just made emphasizes the inherency of what the horse seems to have been evolved for —producing speed; *swift one* was the first name ever applied by man to the horse.

There is it would seem a division of opinion (more apparent than real) among horsemen, some insisting that the trot is a real natural gait of the horse—to the manner born; while others deny it as such (taking the view that the only natural gaits are the walk and the gallop). Therefore, according to the latter the trot is a gait acquired by special artificial means by individuals and handed on to the next generation. If the former view is correct, the trot of the colt is easily explainable as inherent. If the latter is correct it is explainable by the transmission of an independently acquired (individual) character. The assertion, if true—and we believe it is, that the colt-trot is a case of "heredity" does not, as said, dispose of the *vexata quæstio*. There is no doubt about the *heredity*. The question is, from whence did it arise —prior to and as a result of ancestral combinations of themselves of the "material basis of heredity"—*or* as a result of external influences periodically developed without reference to any previous possession of speed in the ancestry?

Woodruff is perhaps the best practical authority available. He entirely disputes the idea of the trot being an *artificial* gait. He asks: "Whether a colt can be found anywhere that does not trot sometimes, and that when he is by the side of his dam before ever the hand of a man has been laid upon him? If it is said that this results from long domestication of his ancestors, my reply will be that it happens among the produce of horses whose ancestors, for more than two centuries have never been used for trotting and were never taught to trot at all, if it is true that the Arabs of the desert only use their horses at the two so-called natural paces—the walk and the gallop." He adds that other equine animals trot *i. e.* wild asses, zebras and quaggas; besides deer and elk. He therefore considers that the most careful attention should be given to the training of a young colt for trotting purposes; for a horse to become a trotter "he should be broken in young to that gait, so that other gaits may be kept in the background." The sooner a preponderating influence determines one of the natural gifts of an animal—as a particular gait in a horse—the more developed will that particular gait be, to the almost total exclusion of any other competing or interfering gift. We believe all trainers, if canvassed, would agree with Woodruff.

Turf Phraseology Implies the Natural Origin of the Gait.—A word here about what are described as *developed* trotters. Perhaps the best examples of these, for the purpose of illustrating the phrase in its nearest relation to the subject in hand, is the case of such sons and daughters of non-standard parents that by training "development" become themselves standard by performance. Of course training "developed" the speed; or, as we

Digitized by Google

have attempted to put it, discovered the speed possible in such horses. It is evident that powers of producing such speed must have been inherent, that is, derived from the ancestry, constitutionally capable of combining in such form as would produce progeny possessing standard powers of various degree. Training developed that *various degree*. Presuming the training had been equal in all cases, unless what we contend for—inherent powers of varying degree—existed, the amount of development—speed—would be exactly the same in all cases. Equal training does *not* produce equal development. Different development depends on different constitution, and that on natural inheritance.

Developed speed therefore, is a test of the do-ability of the animal. Pedigree is, or should be, the record of do-ability —presuming that each generation undergoes the test of development. Thus, "it won't do to tie to pedigrees where there is no speed attachment, and therefore the stallion without a standard record and the mare that has never shown any speed will be conspicuously absent from the breeding ranks." Why? Because it would be a loss of time and energy to go on prospecting, as it were, for ore where it is impossible to find it. Breeders must follow the indications, and when the vein is struck follow it on to fortune.

For instance, further, "May Day, the only mare that has produced two trotters with records better than 2:15, is herself, a developed trotter with a mark of 2:30. There is a big sermon in this fact." Unless she had possessed the endownment of speed she would never have been developed or had a chance of her qualities being handed on. The great gray Guy, who began his career in the "humblest fashion," born in obscurity, and of obscure parentage, "has nevertheless overcome all obstacles and arisen to a pre-eminence unquestioned." "That he has done this *is solely due to his own inherent greatness.*" His sudden though perhaps comparatively late development of speed but clinches the claim of his inherent powers. In his cases training discovered what unfortunately there was no means of discovering from his scant pedigree. His unknown ancestry is no argument against our, or in favor of the opposing, theory.

If it is not true what we claim as to the germ being the fountain-head of force and form, then we ought to see more diffused individual and family rate of progress or improvement in the trotting horse. The average should be obtained from fewer extremes. What we do see is that the supreme gifts of speed are scattered apparently here and there, which ignores the alleged effects of *universal* application to the race of the best known methods and principles of developing. Training, we may admit, is perfect in its thoroughness and so-called, "effect." If it were so influential on the individual and thence transmissibly, on the race, we should see competitions—races—so close, as to make the judges' lot a most unenviable one. But races are not so. It is oftener a case of "Eclipse first, the rest nowhere." Trainers will not waste their genius on "the field." They will devote all their knack, tact and test to such of nature's favorites as have been endowed with the almighty gift they are devoting their time to discover. Budd Doble, for instance, is not a professor of equine calisthenics. He is not in the business for the simple purpose of enforcing the principle of the usefulness of regular exercise on the general health of the equine race. The "string" he is given and plays on, is a selected one. In proportion to the natural endowment he finds, does he develop new "time." This does not detract one whit from the credit due such a trainer. How many of the kind are there? The same principle applies to trainers as to fast horses, etc. All are born—made—*to be* developed.

Lately we have seen training put on a more scientific basis. Lamarkians could never conscientiously disapprove of what is called "overtraining," the more exercise the more speed, is their creed. But Doble for one has discredited this. He does not believe in overdoing a horse by overtraining. Enough and no more seems to be his motto. There is where such system—superiority—lies. One drug is known to be excellent in a certain

Digitized by Google

disease. One physician may kill, another cure a patient with the same drug. It all depends on the combining proportion —according to the individual case.

Trot as they may in all shapes, yet it is not the mere trot that we want them to develop, but the git of wit and fit. We want the speed begot of superior brain power and training. We do not only need speed but breed, brawn but also brain. We want the restraint without the faint; the one that can "set a stout heart to a stay brae." Such a happy combination has resulted in such pulverization of the sands of time by animals like Nancy Hanks. And all that is comprehended in such happy combination is but the result of natural possessions skillfully trained out. We have the two great complementary combinations —the quiescent possession *in* the trotter of all those qualities (of formation and function) awaiting the magic touch of the trainer's hand to "discover" them to the admiring public. Where would Nancy Hanks be without the training? What use would the training have been without the possession in Nancy Hanks of the trotting gift? It was there and training developed it to the full—because, too, that training was of the perfect kind. The better the training of course the better is the development—where that is possible—that is, *exists*. But no training of however perfect a kind could develop speed where it was not naturally present. However fine a musical instrument may be it needs a superior to test its capabilities to the highest pitch. The one is necessary to the other for the best results.

We thus see how absolutely important training is. We regard it, however, as a test of what nature has accomplished, not as a creator of what nature does not possess.

The Lessons Learned from the History of Trotting Development.—The first attempt outside of the circle of leading turf editors and contributors, to study "the evolution of the American trotting horse" from a scientific sanctum was made by Prof. W. H. Brewer, of Yale, who published a paper with the title we have just indicated. This paper was one that received, as it fully deserved, wide notice both in this country and abroad. It was read before the Connecticut Board of Agriculture in 1883, was published in the *American Journal of Science*, April of that year, from which a pretty full abstract was given in *Nature*, the leading English scientific serial. It was hailed by one editor in this country thus: "It was a matter of surprise that a college professor should take up the vexed question of the origin of the American trotting horse." Why any one should have had such a doubt passes comprehension nowadays; for we find the horse has, indeed, been 'making the running' for the theory of evolution for many years.

The American trotter being a breed in course of formation has commended itself to the attention of evolutionists. But with the expression of more recent theories it affords a rare case in point for contemporary and analytical observation and study. We shall therefore attempt to develop the biological importance and status of the trotting horse in regard to the question now broached. In doing so it will be introductorily beneficial to refer to Prof. Brewer's famous essay. In that he says (1883):

"The American trotting horse is an example of a new breed of animals in process of formation. As yet it can hardly be called a definite breed in which the special and distinctive character is either fully developed in quality or satisfactorily fixed by heredity.

"The horse has several gaits which he uses naturally, that is, instinctively; and besides those which are natural he has been taught several artificial ones, some of which have been much used, particularly in middle ages. But to trot fast was not natural to horses; when urged to speed they never assumed it, and until within a century the gait was neither cultivated nor wanted by any class of horsemen. A breed of fast trotters, had it been miracuously created, would doubtless soon have perished in that it would have had no use, satisfied no fancy and found no place in either the social or industrial world as it then was. * * * Reasoning *a priori* the trotter as a horse of use, should have originated in western Europe, as a matter of fact he not

Digitized by Google

only did not begin there, but he was unpopular there till he was developed here. * * * The modern, light steel-spring, one-horse convenient business wagon, as well as the modern buggy, came into common use, after trotting as a sport was established, and after the gait had been extensively cultivated and bred to. The trotting horse is specially adapted to various modern uses, but these uses followed his development, rather than led to it, although in later days this factor has been an important one in the rate of progress. * * * The origin of the trotter was not so simple as that of the thoroughbred.

"Regarding the ideal trotter there is as yet a difference of opinion as to what the form should be and it is too early to decide from actual results. That the gait is now hereditary, that it is the instinctive fast gait with some animals, is certain, but whether this is due to inherited habit, inherited training or to mere adventitious variation and selection I will not discuss."

The last sentence represents Prof. Brewer's position in 1883. Since then he has evidently been giving the matter close study—doubtlessly induced by the promulgation of the theory involving the denial of the transmissibility of acquired characters. In a series of essays, published in recent issues of *Agricultural Science*, which came under our notice while composing these papers, we find him saying: "That the gain of speed has been cumulative, and that for three-fourths of a century, that it has gone on along with systematic exercise of special function in successive generations of the present fast trotters, is indisputable and very evident. Selection has doubtless determined the proper correlation of the various organs involved in the special evolution, but the increase in speed has only come along with functional development, which was enhanced by special exercise in the individual of successive generations. The cumulative value of this, if transmitted would be vastly more than enough to account for all the increase that has actually occurred, great as it is. Viewed as phenomena, there is every appearance and indication that the changes acquired by individuals through the exercise of function have been to some degree transmitted, and have been cumulative, and that this has been one factor in the evolution of speed. The cumulative variation has been most marked since we have had a 2:30 class, that is, since we have produced animals that are swift by heredity, and whose ancestors, as well as themselves, have been exercised and trained to trot. Studied as phenomena, there is not a particle of evidence that these special charges acquired by the individuals were totally lost to each successive generation, and that all that was 'transmitted by heredity' was a something that did not exist in either parent or in any ancestor. There is nothing whatever in the actual phenomena observed anywhere along the line of this development of speed, that would lead us to even suspect that the changes due to exercise of function had *not* been a factor in the evolution, and there is not a particle of evidence, other than metaphysical deductions, much less proof, that it would or could have gone on just the same by mere selection and adventitious variation."

We thus find that from a non-committal attitude in 1883 Prof. Brewer has "advanced" to one of committal, ten years later. He has committed himself to, or rather confirmed himself in, the theory of the older school of evolutionists—or that held by what is called the "American school," which is Lamarkian and anti-Weismannian. This distinguished teacher's attitude, will, without doubt, have considerable, in fact great, influence with a large number who are, or will become, interested in breeding problems. While we have found ourselves unable to persist in the old theory, but have been inspirited to adopt the newer view, we feel constrained to express only admiration for the conscientious thoroughness which this teacher in Yale has brought to bear on the subject.

We shall endeavor to find out whether the great development and improvement in the trotting horse has been as Prof. Brewer indicates, general—equal as it were all along the line, due to the uniform influence of training; or whether it has been more special, in certain directions, due to inherent abilities developed

Digitized by Google

by training. It ought to be especially observed that Mr. Brewer evidently deals with the trotting family as if it were a composite whole accomplishing certain record results according to the force directed to "grinding out" the same. But compositeness is just what the trotting horse has not yet become possessed of. Neither interbreeding nor training (internal or external influences) have yet accomplished that consummation for which all its lovers devoutly long.

We have now to come to a more particular examination of this. And we have to enquire what the *practical* horseman has said on the character of the evolution in progress. In doing this there has been produced, very fortunately, and ready to hand, just the sort of information which we believe students have been in want of.

We refer to passages in an article, published in this magazine (September, 1892,) by an able writer, which contains an exposition of the biological importance of *trotting pitch.*

Earnest students in the field of hereditary problems must acknowledge the exposition referred to as of the greatest possible value. It comes as a message from an impartial observer of an interesting, progressive evolution. This message is thoroughly independent of bias derived from any theory of heredity. Let us see then what the message is:

We are confronted at the start, with the fact—at total variance with all preconceived ideas of balanced symmetry and mechanism—that the four fastest trotting performers—Sunol, Palo Alto, Maud S. and Nancy Hanks — are all higher over the coupling; and that the eight trotters that have beaten 2:12, including in addition to the above, Allerton, Nelson, Arion and Delmarch, are also all higher over the coupling, with the single exception of Allerton, thus making seven out of the eight greatest performers that are so endowed with the distinctive trotting pitch.

Such a result "in the face of the manifold incongruous elements that have entered into the formation of the American trotting horse, and the rapidity with which he is evolving in both lineage, conformation and performance, is," we believe, one of the most remarkable and noteworthy facts of modern breeding.

Now the "seven out of eight" in the possession of this distinctive conformation have derived it by heredity. It is this heredity that we are here concerned with and must investigate.

But before doing that, let us attend, as the author we are quoting has so successfully done, to the case of Allerton and other fast ones not possessed of the distinctive trotting pitch. In no less degree has their conformation been controlled by a supremacy, or greater quality, of tendency to extra high withers. For the satisfactory physiological explanation of this we must refer the reader to the remarkable article to which we are here so much indebted. In short, that explanation is: The coincidental occurrence of preponderance of that conformation in the ancestry which distinguishes the Mambrinos from the Hambletonians.

Allerton, "the one out of eight," and his like belong to the Mambrino Chief house, the other "seven out of eight" belong to the Hambletonian. The fact here stated is the greatest and most important students of trotting genealogies have generalized for us. It is of the highest scientific value. A statement "of the respective potency of the above sires, as obtained from the Year Book for 1891, accentuates the fact mentioned: Hambletonian (10) sired 40 standard performers, and 59 daughters the dams of 73 trotters and 1 pacer, and 129 sons the sires of 954 trotters and 48 pacers. Mambrino Chief (11) sired 6 standard performers, and 17 daughters the dams of 23 trotters, and 23 sons the sires of 87 trotters. What is the biological explanation," pertinently asks our author, "of this enormous discrepancy?" "The Mambrino family have become famous," he says, "for great speed and courage. Guy, 2:10¾, and Prince Regent, 2:16½, and Mocking Bird, 2:16¾, and Black Cloud, 2:17¼, and Jerome Turner, 2:15½, leaving out the mighty mare Lady Thorne, 2:18¼, have demonstrated its great capacity for great speed and indomitable gameness. These seven best had the Mambrino Chief conformation. They were higher in front than over the coupling. Compare with them Sunol, and Palo Alto, and Maud S.,

Digitized by Google

and Nancy Hanks, and Arion, and Delmarch, and McKinney. These are the seven best of the Hambletonians that have the Hambletonian conformation or trotting pitch. The test of gameness is in indirect ratio to the rate of speed maintained. Granting that the courage was equal in both families, the vastly superior speed in quality, as has been shown in quantity, so largely predominates in favor of the Hambletonians that it is an unfounded assumption to claim that conformation is not an influential factor in this startling comparison."

Hambletonian stood an inch higher behind than in front, Mambrino Chief was exactly the reverse in his conformation. This conformation was not accidental in each, it was an inheritance.

The descendants of each have preserved in the main these structural differences in conformation, with the results already stated.

Electioneer, the premier stock horse of Palo Alto, has the Hambletonian trotting pitch. "But Electioneer is not alone, among the great trotting sires, with this structural formation. As George Wilkes, and his best son, Red Wilkes, and the greatest sire of standard trotters, the great Nutwood, are all similarly possessed, the coincidence is certainly not accidental."

Electioneer had round withers—the trotting wither—in contra-distinction to the sharp withers of the thoroughbred. All his most distinguished sons were from a quarter to a half an inch higher at the coupling than at the withers—with either sharp or round withers. The trotting pitch has become more confirmed in each generation.

The same remarkable conformation belongs, it appears, to the thoroughbred Palo Alto mares that have produced trotters. The most noted example of this, Dame Winnie, stands one inch and three-eighths higher at the coupling than at the withers. "This is a most exceptional conformation for a thoroughbred." It seems that she was selected as a thoroughbred because she showed such remarkable trotting action. "From her pronounced trotting pitch such action was the natural result of her structural formation."

When the biological student "compiles a mass of facts all tending to one incontrovertible conclusion, the trotting pitch seems to be on the border of general recognition."

When it is remembered that "there has been no crossing or breeding with reference to the trotting pitch and that nature, unaided, has thus plainly indicated that formation as the best possible structural adaptation to extreme trotting speed, and the attainment of a higher average of trotting speed, it is the more remarkable that the proper form should be thus strongly and generally indicated. Instead of two out of eight of the greatest trotting performers being the exceptions, the wonder is, taking into consideration the positive disbelief in the trotting pitch, as well as the absolute indifference to the same, that the exceptions are not numerically greater." Indeed from answers received on this subject from horse owners, the author quoted is convinced that "if a tabulated list of all the great trotting sires and of the most distinguishable trotting performers had been preserved, of the relative heights over the coupling and at the withers, it would be found that the trotting pitch is the almost universal rule with the best trotting strains, excepting the Mambrino family, and that the reverse would be the rare exception."

The exception only tends to emphasize the whole case when due appreciation is given to the peculiarly strong forces at work inducing such casual submergence of an inevitable tendency. "Thoughtful students of physiology have maintained that the carcass should be balanced, equal in height at the withers and over the coupling, which measurement should correspond with the length of the carcass from the point of the shoulder to the posterior extension of the hip. Then, it is exclaimed, the body is balanced, and in the best possible position for the greatest speed. They furthermore assert that undue height at the withers, which is the 'defect' of the thoroughbred formation, and a greater height at the coupling, which 'disfigures' so many great trotters, and the drooping of the hind quarters that 'mars' the symmetry of the old-time pacers are all physiological imperfections. The perfect trotter, they con-

Digitized by Google

clude, will never materialize till these unequal sections are reduced to a balanced mechanism. Others assert with equal confidence that, physiologically considered, the swift trotting horse is *sui generis*, so far as relates to his exceptional structure, that so bids defiance to the laws of physiology. He assumes all shapes, sometimes higher behind, sometimes higher in front, and sometimes equal in height at both ends. They admit that the pointer, and the setter, and the collie, and all the varieties of lower animals bred for a specific purpose have a distinctive conformation, but the law ceases to have any influence when the trotting horse is under consideration. They deny that these variations in the trotting form result from the crudities of breeding, or the absence of the evolution of a distinctive type, but that the trotting horse is the one single exception in animated nature, to the otherwise inexorable laws of physical construction. He always has, say they, and always will, come and trot fast in all shapes, and there never will be evolved a distinct physical type."

In the above we have the following: Nature in disdain of all opposition possible to the contrary, forces us to acknowledge that (1) the greatest speed *is* associated with a certain conformation described as trotting pitch; that (2) those possessing it have undoubtedly obtained it as a legacy, from a certain line of ancestry. Now these two general facts, taught us by the practical horseman, appear to be facts that do not seem to have been noticed or taken into consideration by Prof. Brewer. In fact he is positive *no* distinctive conformation has yet been indicated in the evolution, from the manifold crudities of composition, of the trotter. Now, bespeaking a fair view of the position we are defending, we would submit it could not be expected that a generally distributed cropping out of a certain tendency, in conformation toward one equally progressive result would be therein simultaneously evolved. We would rather expect such indicative tendencies to burst out at different but definite points. *Such is the case.*

In spite of artificial training, selection and breeding, all directed to attain a balanced symmetry, nature has spurned as of non-transmissible effect all such influences on herself to induce her to yield a fruition of speed-conformation. Nature has burst the bonds of Lamarkism that breeders have attempted to trammel her with. She has burst the shackles and asserted her own natural bent. To her would-be controllers she whispers: *Naturam expellas furca tanem usque recurret.**

In its evolution of the American trotting horse nature ever comes at us with the trotting pitch. She does not find it possible to do so everywhere. This is really the greatest argument in the whole system of the process of natural heredity we are attempting to display. If nature developed such indicative conformation all along the line—in direct proportion to the influences brought into play—she would not favor the theory we support. But, appearing here and there, bursting out at different points as in high peaks belching forth evidences of deep internal force, we have the best possible argument in our favor.

Emitting such evidences at such apparently (for the moment let us suppose without reference to any source) different points, we have a very fair example of what are called *fortuitous variations*, about which we shall have something explanatory to say. These have peeped out scatteringly, in spite of all *certain* forces supposed to have been at work for a totally different result. But, tracing as it were the roots, from which these, here meantime so-called, fortuitous evidences emanate, we find them all descending by main, leading stems to one point, and that point is labeled: *The congenital source of variation.* The source of change is in the root or stirp, not in the branches or twigs; in the originating germ-plasm, not the originated body-plasm.

It would therefore seem that argument from the standpoint, of regarding the trotter as a *composite* whole, must be regarded at present as erroneous. If compositeness is wanted, breeders must elect what particular blood and formation are the speediest, and breed to that, gradu-

*"You may drive nature out with a pitchfork—by violence, but she will always come rushing back."

Digitized by Google

ally eliminating all else. When that is accomplished, then only shall we have a composite breed. At present, as to what breeders are continually aiming at seems to be found in certain strains or special lines of blood *alone*, *not* in every one.

One man, says the old proverb, may take a horse to the water, but nine men will not make him drink. The breeder has been a good deal like the horse in the proverb, where nature has volunteered the office of leader.

The perfectible trotter will certainly never materialize if those, blind to nature's hints, and ignoring them, will continue to advocate such crudities in breeding as to pair them in "all shapes." Nature has no such exception to its own rule as these sanguine gentlemen suppose.

In spite of all attempts to prohibit nature's work, in spite of breeding to a heterogeneous—mixed—type, nature has, by sheer force of character and heredity, overcome all obstacles and belied all theories (of balanced symmetry) and has pointed out clearly what is evidently the true conformation of the trotting horse. Its natural evolution can not be restrained by an artificial idea of breeding.

We are not specially dealing here with the evident means of further enhancing this trotting pitch, which might be expressed in the saying: Wherever nature does least man does most—that is in strains (or blood lines) in which it does not pronouncedly exist, the breeder can engraft it by using scions of the stock in which it does so exist. What we are aiming at is to account satisfactorily for its origin—its first arising. As far, therefore, as trotting pitch has been traced, we find that its "keel" has been laid by nature itself.

By the natural endowment of the germ-plasm, implying tendencies to vary in certain directions, the trotting pitch evolved itself and became transmitted in certain lines of descent. It has practically, apparently lain dormant or latent—overlooked, ignored, disowned, opposed by all the powers of "known" breeding principles. Still it has asserted itself so repeatedly that it could not be further ignored. It was, in truth, "discovered." How? By the supreme *test* of training.

The credit of this, as all others affecting the improving advancement of our domestic races—must be given to the subtleties of the trainer's art—in its numerous phases. Of course, animals possessed of trotting pitch might trot without training, but it is only training that can develop it to its utmost capacity.

A story goes "that a generation or so ago a gentleman named Rapely bred thoroughbreds extensively in South Carolina. He was an Englishman and imported a lot of the most purely and fashionably bred stallions and mares that could be found in Mother England. He was passionately fond of racehorses, but he never would train to race them.

He believed in pure blood and was scrupulously careful in making crosses. In the course of time he had reared a tribe of richly-bred thoroughbreds that had never seen a race-course. He kept this up," so says the chronicler, "through several generations of horses. At last the attention of horsemen was directed to them. Numbers of them were selected and tried, but, with all their purity of lineage and superior elegance of form, they were found not to be racehorses." This is a very interesting "story." One little point is liable to be overlooked, however. We are told that Rapely *never* raced or trained his horses. This would indicate two things, *first*, that he did not look for racing form and *secondly*, that in selecting his stock in England he would similarly overlook that material item. He would be carefully, therefore, by the quick-witted horseman, shown the blue-blooded beauties for which there was no racing outlet. Hence the material possession, generally first sought for by racing lovers, was wanting in Rapely's selection. The result, with his system of breeding, could be foreseen. It is a case similar to one of the two supposititious examples given by A. R. Wallace, quoted already.

Training in thus developing the inherent endowments of the great trotters, thus selects out from the general mediocc-

rity the fastest naturally. Those so selected out are the equivalents of those in the domain of nature that are favored for survival above their lesser naturally favored companions. Those best endowed come out of the trial, stand the applied test the best, just as do the survivors in nature.

With this great fact of the selecting out the best naturally endowed with "flight of speed," we have the further fact of its association with trotting pitch.

Therefore those possessing the inherent variation that has produced, or can produce this "conformation" have been given a natural advantage from nature not possessed by others. They are therefore capable of leaving the less favored behind in the general ruck of the race, are lost to them in the dust of their speedier heels—solely on account of the inherent possession of superior natural gift, splendidly responding to the call of trainer at the moment he has chosen to snatch victory from all competitors in the race.

It would naturally follow that a select circle should be drawn around those attaining such a mark, and that all not attaining such mark should be excluded. That is the teaching or process of natural selection. But we are anticipating.

Further examining those now in the select circle we find as still an additional fact, that they have been developed out of certain lines. "All roads lead to Rome," and it appears that all trotting pitch conformation traces to Hambletonian. Hence "All Hambletonian Blood" should be the watchword of advance in the future.

The influence of the exercise of function was not specially in force when trotting pitch was evolved. And apparently, since that influence has been in force it has only been developed where it existed.

Nature has no recourse but to "lay it up," for those who were so fortunate as to discover and appreciate it. Training has brought out of those possessing it the greatest records of speed. Common sense should inspire the breeder, therefore with the true aim in the future.

"*Trotting-pitch*" *not Confined.*—The conformation of the renowned Eclipse was also at variance with "all preconceived notions of equine symmetry." His shoulders were very low, oblique, and so thick above that according to the observation of the time "a firkin of butter might have rested upon them." He stood very high behind, a conformation "suited to his great powers of progression." He was, also, it is stated, so thick winded as to be heard blowing, at a considerable distance, and "galloped as wide as a barn door." (Low, p. 528.)

A volume was written on his proportions by M. St. Bel, the French veterinarian who founded the London college, whose investigation shows that his figure differed immensely from the conventional idea of form which writers had assigned as the standard of perfection. The above to us, seems to indicate that the most natural speed conformation to be evolved is the *trotting;* therefore indicating trotting as a most natural gait. In fact Eclipse was born a trotter to become a runner.

Trotting-pitch must out wherever it exists in thoroughbred or trotter. Thoroughbreds might be developed into good trotters as the latter into good runners—by training. For instance "Messenger's own trotting powers were noticed whilst he was in training as considerable for a horse meant for galloping, Lord Grosvenor offered to bet that he would accomplish fourteen miles within an hour," a record rate for his time. Trotting was as natural to him as running.

All the above points to the natural evolution of the trotting pitch—which training test has unmistakably proven to be the acme of trotting "form."

It might be said of the Hambletonian influence in the American trotter as Col. T. A. Dodge remarks (apparently in a general, but, so, rather loose way) in the December *North America Review*: "The very anatomy has been changed by breeding."

This is true *specially*, and would be true *totally* if breeding operations were confined to reproducing solely such changes in the anatomy.

[*To be continued.*]

CONTRIBUTIONS OF THE PACERS TO THE TROTTING RECORDS OF 1892.

BY L. E. CLEMENT.

EDITOR OF THE MONTHLY:

So much is being written about the trotting-bred pacer that it may not be out of order to go back a little and look at the contributions of the pacer to the trotting records.

June 14, 1871, James S. Wade entered and started a bay pacing-bred trotter at Jackson, Mich., winning the last three heats of the race. This gelding afterward became famous as Red Cloud and made his record of 2:18 three years afterward at Buffalo, N. Y. This was the first performer, of a great family of trotters and pacers, and few families are now better known at the meetings where fast pacing and trotting is in order, than the "Sub family," if you will, of Legal Tender.

In all Legal Tender sired four sons and daughters that took trotting records of 2:30 or better, none of them having trotting-bred mothers — in fact, little seems to be known about the maternal blood lines of any of them. Legal Tender is also credited with four sons that have sired eight 2:30 trotters, among them the black horse Legal Tender, Jr., or Amos' Legal Tender, the sire of five trotters and six pacers to the close of 1891. Nannie Hedges by Ned Hawkins, son of Legal Tender, and her dam claimed to be by Blue Bull, is the dam of Rosemont, 2:23½, and Old Judge, 2:29½, and one of her daughters produced Clairmont, 2:28¾.

The first two-year-old stallion to trot in 2:25 was Shamrock, by Buccaneer that was out of Tinsley Maid by the pacer Flaxtail, and his own dam was Fernleaf, 2:40 (pacing), by Flaxtail, and she out of Fanny Fern by Tuckahoe (pacer). The trotting records were badly used in 1892, but one stands out conspicuously, and that is the yearling record of 2:25¼, Frou Frou, sired by a pacer, and out of a mare by Buccaneer, whose dam is by the pacer Flaxtail, and her dam Mahaska Belle by Flaxtail.

One of the best three-year-old trotting race records is held by Czar, son of Russia, son of Nutwood, out of a mare by Legal Tender, dam by Blue Bull, and this fellow made a two-year old record of 2:27, and was the first of the get of his sire to enter the standard list. The four-year-old trotting record was held for years by Manzanita whose dam was by the pacer St. Clair.

Many will claim that the pacer was a great help in the foundation stock, but that we are getting so far along that we do not need the blood, and yet the yearling trotting record, and one of the fastest three-year-old race records are from close-up pacing blood on the dam's side. Among those that are not record breakers we have Harry Phelps, that was owned over near Blue Mound in Kansas, by two brothers, and took a record better than 2:35 at both gaits, one brother driving him at the trot and the other at the pace. Last season has not only seen him start a 2:30 list, but his daughter, Kitty Hiatoga, has been a consistent performer at the trot and now carries a record of 2:18¾.

Brussells, 2:30, pacing, by Blue Bull, the founder of the greatest of all the pacing families, is the sire of Allen B., 2:20½, first making a record of 2:24¼, and reducing it from that.

M. W., 2:24¼, by a son of Blue Bull, was purchased last spring for $100, and won the 2:29 trot at Columbus, Ohio. His sire, Billy Hinsley, is not registered.

Franklin, by Tobe, Jr., son of Blue Bull, won a ten-heat race, entering the 2:20 list, and was second in the only other heat trotted better than 2:20.

Walkill Prince, to the close of 1892, had six in the 2:30 list, four of them are out of daughters of Blue Bull, one out of a daughter of Pocahontas Boy, and one out of a daughter of John Black, son of Blue Bull, is now in the 2:20 list.

Guiado, the first colt to enter the 2:30 list for Pistachio (full brother to Nutwood), not only carries the blood of the pacing-bred Pilot Jr., sire of Miss Russell, but is out of Primrose, the great daughter of the wonderful old pacing mare Black Rose, by Tom Teemer (pacer). All these are new contributions to the

Digitized by Google

trotting records of 1892. Bonnie Doon, by Rooker (Billy Stranger), the Ohio-Michigan pacing sire, entered the list in Kentucky. It is only a few years since the daughters of American Star led all the rest as producers of 2:30 speed, but they soon gave way to the daughters of Hambletonian, and now again they are superseded by the daughters of the old pacer Blue Bull, that now ranks next to "the Hero of Chester" as a sire of producing daughters at the trot, but when it comes to the dams of pacers Blue Bull will probably outrank any other sire.

Of the great three-year-old pacers of 1892, Alhambra, 2:15, is by Legal Tender, dam by Blue Bull; Sunset, 2:16¾, by Billy Davis, son of Blue Bull. Although this fellow made a record of 2:28 as a two-year old, there is nothing in the 1891 Year Book to indicate the breeding of his dam. Nelly McCrory, 2:18¼, is by Legal Tender Jr., dam by Tobe Jr., son of Blue Bull; and Rettla, 2:19¼, is by Kimo, son of Blue Bull; dam by Blue Vein, son of Blue Bull. So it is, in and out, the dams of fast pacers are often the dams of fast trotters, and the horse that sires fast trotters with regularity will, just as surely as water runs down hill, sire fast pacers, I care not what his blood lines are.

Lady Yeiser, by Garrard Chief, son of Mambrino Chief, is the dam of Don Pizarro (3 years), 2:14¾, and his sister, Lottie Loraine (2 years), 2:16½, is also the dam of Mistake, 2:29½—trotting.

Clinker, the old blind pacer, is the sire of the fastest stallion yet foaled in Missouri—Lynwood, 2:20½, and he has three trotters with records better than 2:25. Herschel, sire of the fastest three-year-old stallion bred in Missouri, Prince Herschel, 2:21, and the great campaigner Neva Seeley, is out of a daughter of old Black Rose, the pacer. No horse that I remember except Roscoe Conkling has yet sired two colts to trot better than 2:20 and out of mares of unknown breeding.

Smuggler, the converted pacer, is breeding on through both sons and daughters, and is more successful than many of his high-bred contemporaries among trotting families. Bayard, as a progenitor of both trotting and pacing speed, is fast gaining on his sire, Pilot Jr., and in all probability will make a greater showing in the first and second generation than Pilot Jr. Flaxtail, that has made such a wonderful showing through his daughters, has added a second to his own 2:30 list. Blue Bull, that has now been dead twelve years, has this year added to his list—Phillips' Blue Bull, sire of Alti, 2:18¾, and the trotter, Stewart Mac, that has three times been added to the list of 2:30 perfromers, and twice dropped for irregularities. Over thirty of the sons of Blue Bull are now sires of 2:30 trotting speed, and nearly one-half the sons of Blue Bull that were kept entire have sired 2:30 speed at one of the two harness gaits.

These are only a few things that are shown in pacing pedigrees among the trotting records of 1892, and there never will be a smaller showing. The trotting-bred pacing sires will cut a figure one of these days that will surprise those old fossils that don't want a stallion that sires pacing speed. Keep an eye on Wilkie Russell, Happy Russell, Happy Heir, Sidney, Alley Russell, John R. Gentry, Coramont, Riley Medium, and other young pacing sires, that will yet count long lists among the trotters.

BELLE OF WABASH.

BY J. W. BROWNING.

About the year 1856 there came to the old Fair Grounds track at Indianapolis, in charge of John Williams, a beautiful black three-year-old mare about 15¾ hands high, with one white hind ankle, that at once attracted the attention of all the horsemen in that vicinity. This mare was as fine a type of a thoroughbred in appearance as the invincible Ten Broeck, and not unlike him in form; there was nothing of the wasp-like structure which characterizes so many

Digitized by Google

of the racing sprinters of the present day.

I have seen all the noted trotters that have appeared for the last thirty-five years, but none of them could compare in structural points, grace and symmetry with this black mare. She was called "Belle," simply plain Belle without affix or prefix; but in order to distinguish her from a local mare of the same name the horsemen got into the habit of calling her "Wabash Belle," and under that name I trotted Emerald against her several times and also drove her in several races; the last race I ever drove her was over the Woodlawn track at Louisville about 1864 in a race against Lady Thorne (then called Ashland Maid), Belle Chaplin and others, winning second place in the race.

The mare has passed into history under the name of "Belle of Wabash," and is now more noted as the dam of "The Moor," who sired the great brood mare Beautiful Bells, Sultan and others.

In order to avoid confusion of names I will hereafter speak of the mare as "Belle of Wabash." Belle of Wabash was bred by a resident of Montezuma, Ind., a small town located in the Wabash valley. She was sired by a horse owned by Mr. Whisiker, Attica, Ind., called Bassinger, by Lieutenant Bassinger, who was sold to my father and Mr. Patterson about the year 1857 as a thoroughbred.

I never examined the Stud Book to find out whether this horse Bassinger is registered or not, but I do know that he was sold and stood for service in Indiana as a thoroughbred, and that in appearance and temperament he was a typical thoroughbred. Bassinger was traded by Mr. Patterson to John Alexander, Franklin, Ind., for "Belle of Wabash," then seven or eight years old.

John Williams, now of California, broke "Belle of Wabash" when a three-year-old. The "late" Mr. Wallace, learning of this fact, wrote Williams for the breeding and history of the mare, and was referred to me by Williams as the person in the "States" who knew more about "Belle of Wabash" than any other man to his knowledge.

Having given the "late" Mr. Wallace all the facts in my possession, it seems strange that he should have continued to give the breeding of "Belle of Wabash" as entirely unknown. Had the thoroughbred (Bassinger) cross in this mare's pedigree been a pacing or trotting cross it would doubtless have been accepted. It is certainly as well established as the recently-discovered fact by Mr. Wallace that the great English race horse Mambrino, sire of Messenger, belonged to an English pacing family that is unknown outside of the addled brain of the eminent compiler whose nightmare is a thoroughbred.

Indianapolis, Ind., January, 1893.

[In connection with this letter, the following extract from a recent issue of the *Western Horseman* is interesting reading.—EDITOR.]

This Indiana mare, known by only one son, whose foals in time made him famous, occupies a unique position among the great brood mares of the country. Without absolute certainty as to her sire, with only sufficient opportunity to show that she had speed, soundness and endurance and to secure a local reputation, she passed out of sight to become an object of curiosity and investigation when her descendants in the first and second generations revealed extraordinary merit, and now that the lineage not only of the stallion king, Stamboul, 2:07½, but of Sable Wilkes and his swift youngsters, of Beautiful Bells and her progeny, Chimes, sire of seven, and many more must end in one line of search, Belle of Wabash; the individuality of this Indiana product is still a matter of interest.

Near the western border of Central Indiana there is little doubt that Belle of Wabash was sired by the bay thoroughbred Bassinger, owned by Mr. Weisiger, a respectable farmer and a breeder of horses.

Bassinger, son of Lieut. Bassinger, out of a daughter of William IV, whilst not remembered by anything but this one mare, made considerable impression upon the stock of Western Indiana for many years after 1852, where his fine style and spirit appeared in the well-

carried heads, arching necks and good road qualities of the foals of Bassinger out of ordinary Hoosier mares. A nervous and excitable force and great gameness marked the black mare, who for some years made the rounds of fairs and little races. She was a three-year-old filly when her owner, a resident of Montezuma, a village on the banks of the Wabash, discovered by her running away with him that she had speed at the trot as well as otherwise.

A full sister to Belle of Wabash, very much like in form, color and spirit, was owned by a horseman in Terre Haute, who found her to be a born devil, not to be broken.

The famous horse-tamer, Rarey, while in Terre Haute, tried his art on her and failed to break her. Her owner traded her to a man in Indianapolis, but he discreetly provided that he was only to deliver her on the cars at Terre Haute. Belle of Wabash herself, while recognized as a good race mare for all distances, up to five and ten miles, was said to be hot-headed and a puller, and possessed a force and soundness of body and limbs which evidently has been impressed upon her family to the fourth generation.

She was undoubtedly thought good and was valued at a $1,000 a very good price in that part of Indiana before the breeding of trotters had become a pursuit.

Through her son, The Moor, bred by George C. Stevens, of Milwaukee, she was a queen dowager of a splendid line. There was something in the atmosphere and circumstances of California to develop very showy and elegant and popular lines of trotters. The felicity of the nomenclature adopted in naming the colts and fillies, not equaled elsewhere, may have had a little to do with attracting attention and popularizing some of the California families, though of course true merit also belonged to Minnehaha, Beautiful Bells and their happily named offspring. There is quite an oriental picturesqueness in the names of The Moor, Sultan, Stamboul, Alcazar (Spanish from an Arabic word), Amurath, Kismet, Othello, Saladin, Moonstone, *et al.*, and a tinkling rhythm in Minnehaha, Beautiful Bells, Chimes, Bell Bird, St. Bel, Bell Boy, Bow Bells, Midnight Chimes, and so on, but much of this graceful naming was suggested by the Indiana men who gave Belle of Wabash her name.

The Moor, the black son of the ebon-coated mare, must have transmitted some of his dam's attributes to his small but very select family which contained the great Beautiful Bells, black mare dam of seven; Bell Boy, 2:19¼; Bell Bird (1), 2:26¼; Belleflower (2), 2:24¾; Hinda Rose, 2:19½; Palo Alto Belle, 2:22½; St. Bel (4), 2:24½; Bow Bells, 2:19¼; and of Chimes (sire of seven), and superb Sultan (sire of Stamboul, 2:07½), Sable, black mare, dam of Sable Wilkes (3) 2:18; black horse (nine in the list) Leo Wilkes, 2:29¾; Ulee Wilkes (4), 2:23, black filly, and dam of Rupee, 2:11.

Of Minnehaha's great brood of six trotters and of producing dams, the only foal by The Moor was the wondrous black mare Beautiful Bells, undoubtedly the greatest of the band, but another brood mare whose story is not fully told is Sable, granddaughter of Belle of Wabash, whose son Sable Wilkes may outstrip the remarkable sire of early and extreme speed, Guy Wilkes, since at eight years old he has in the list the speedy juveniles: Freedom (1), 2:29¾; Macleay (2), 2:22¼; Sabina (2), 2:27½; Ora Wilkes, 2:21½; black colt Lon Wilkes (3), 2:20¾; Lallah Wilkes (3), 2:26; black filly, Wilkes Blanche, 2:26½; black colt (formerly called Native Son) Sabledale (2), 2:18½, and Puritan, 2:29½, surely an unequaled list.

Sable has also to her credit Leo Wilkes, 2:29¾; Ulee Wilkes (4), 2:23, black filly, and the dam of Rupee, 2:11.

The roll of the descendants of The Moor, son of Clay Pilot, and Belle of Wabash has a sumptuous look, as it covers Beautiful Bells and her progeny, St. Bel and his get, Chimes and his seven, Sable Wilkes and his phenomenal nine, Stamboul, 2:07½, "and he shall be king," with his ten, Sultan, his greater sire, and his twenty-eight performers, Alcazar and his five and the list can be extended to monotony, in honor of the unmarked, unregistered mare from the Wabash.—*The Western Horseman.*

SUNDRY SUGGESTIONS.

BY RAY MARSHALL.

IT is now the season of the year when there is often disposition to neglect the horse stock. The average farmer is given to looking after various items of indoor chores, such as mending harness and other articles, which may be done in the shop by the fire. The result is that too often the colts are allowed to run in the snow of the pasture and stalk fields with all the freedom of wild animals.

Their only means of domestication is found in their being supplied with some coarse provender or hay once a day, often some distance away from the barns and ordinary yards. It is extremely unfortunate that the full scope of horse breeding and management is not more fully comprehended by those who have the early training and fixing of the habit of the coming horse in their hands. It may be said, of course, that it is much work and bother to tie up every equine that is growing up on the various stock farms. It is forgotten when this complaint is entered that it is the numerous little things in the way of handling that make the horse in after life valuable as a thoroughly trained animal. It is the frequent haltering and contact with the men and boys that tends to establish confidence in mankind, and it is very difficult in the later life of the animal to make up for this lack of early handling by any other substitute. The only purpose for which horses are grown is that they may be faithful servants of men, women and children in later life. As is true of children, they learn and acquire habits much more readily and perfectly in their youth than when they have passed the age of three years.

In the way of light handling the colt should be taught as much as possible before it is two years of age. Just at this season is an excellent time to handle the yearlings, and by handling we mean to say that they are to have judicious, careful training, such as bridling, harnessing, hitching up together in pairs and driving short distances to light vehicles, with very light loads. By light vehicles we mean a light-weight lumber wagon that is strong enough to bear their pranks and the effects of their awkwardness, and at the same time not too heavy for them to draw. For such youngsters not to exceed an hour's handling in the morning and another hour in the afternoon is advisable, though with judicious care they may be driven to town or on some errand in which they may be tied to a hitching post and allowed to stand (thus learning a lesson) for only a few minutes. Such a trip might occupy altogether two hours without detriment. There is danger, however, that they will be brought into perspiration and allowed to take cold when exercised for too long a period in winter weather. Of course much of the preliminary training which will tend to quiet the nerves of the youngsters and to establish fairly their confidence in their driver should be done before they are driven on the road at all. By this precaution they may be prepared to do the work outlined above with scarcely any fretting; and by using blankets promptly when they are tied in the streets, and also when they are put away in the barn, and by rubbing down their limbs thoroughly with a good wisp of straw they may be kept without cold and may be made much more valuable a year hence from the effects of this preliminary discipline.

One of the results of this early care, as every experienced horseman knows, is that much of the danger which accompanies the breaking of horses when they are fully grown is done away with. The youngster is not so self-willed at this time, and it requires less strength and much less patience on the part of drivers to handle such colts. It need only be suggested that, as a rule, such a youngster should be driven a few times in double harness with a steady, smart horse, from which animal it will readily learn much by imitation. It is also a much easier method of training from the start, and exposes the persons concerned to much less danger from violence to

Digitized by Google

themselves, and from accidents in the way of breakages of harness, vehicles, etc. But where there are pairs of colts as soon as fairly trained in this way, it is desirable that they be put together. Of course the experienced expert in handling horses needs hear only the suggestion that he be faithful in season and out of season, in the cold weather as well as the pleasant days, applying himself regularly to the task of training the youngsters. Scarcely less important are his duties to mankind than those of the teacher of children, from the fact that the animals passing through his hands afterward become the servants of trusting people, who take for granted the understanding that the man who converted the natural youngster into a trained driver did the work thoroughly and well.

Of course there must be constant thought to avoid giving an indifferent, lazy disposition to colts. At such times it is necessary to feed well, and thus not only maintain the usual strength, but also keep the animal growing and in the full vigor of its life. It is possible in such cases, by careful grooming and attention to proper diet, to secure much better development of the physical frame of the coming horse than is usual where the animal runs at will and feeds indifferently. It is important now to guard against the feeling which often possesses the boys about the barn to make pets of the colts, and to engender in them the disposition to be too playful. Just enough work is needed to make the youngster feel that life is truly, with it, a serious business. It is also desirable to have it feel its dependence largely on the men with whom it is associated, and to this end it is a good plan for the one driving and handling, if possible, to administer to it its feed.

WINTER CARE OF STALLIONS.

There is no one department of the breeding interests, especially in this New England climate, of more importance than the winter care and management of our stallions. It requires no scientific scholar to appreciate the fact that posterity or descent depend much, I might say wholly, upon the conditions of parentage. It has been demonstrated beyond question that diseases, dispositions, and, in fact hereditary and accidental malformations are transmissible to the third and fourth generation. I can not agree with many of our breeding students that accidental malformations are not to be seriously considered in the selection of our sires.

I will cite one case that came under my personal observation. The stallion Tom Patchen, by George M. Patchen, met with an accident in a race over Old Forest City Park, Portland, Me. The accident consisted in a fracture of the wing of the pedal bone of one of the hind legs, which caused a crooked ankle. That stallion was afterward mated with a mare owned by Mr. Munger, of Portland. The progeny was a filly, born with the precise malformation of her sire, and the malformation always remained with the mare.

I refer to this case simply to impress upon the reader the importance of every detail of the breeding business, and to show how imperative it is that the stallion should be in the highest state of vigor and health when mated with the dam. All the attending circumstances of that union should be in harmony with the perfect law of reproduction. I do not claim that curbs, ringbones and spavins are invariably transmitted, but that there is always a predisposition to such in the offspring, if they exist in the sire.

Upon the same hypothesis I contend that bad dispositions, unhealthy conditions of the sire, such as thrush, grease, ophthalmia, humor of the blood and skin, induced to a great extent by improper winter care and management, if present in the stallion, is likewise predisposed to exist in his descent. While I am a very firm believer in the potency of blood lines, yet I am disposed to attribute much of the success of our greatest sires to the scrupulous care and excellent management they receive. On

Digitized by Google

the other hand, I am of the opinion that much of the failure on the part of others can be traced directly to a want of care and mismanagement on the part of their owners.

The great stallion George M. Patchen signally failed as a sire to meet the high anticipations of his admirers, and to a great extent I believe that failure can be reasonably explained in the want of care and in the abuse to which that great horse was subjected. I hold that if the two greatest sires the world has ever known (Electioneer and George Wilkes) had been subjected to the same unmerciful treatment as George M. Patchen received, their name and fame would have been alike clouded with his.

If so much then depends on the care and management of the stallion, the question arises, What is the general detail of care and management that induces the highest physical condition and prepares the horse to transmit the most desirable qualities? That query is answered by seeking that care and management that induces the most docile disposition and the highest state of vigor and health in the horse.

It requires no extended treatise on humane treatment to establish the well-recognized fact that the day of the whipping post, with the use of cruel appliances formerly used upon the stallion, has happily passed away. A lump of sugar, a potato, apple or some other palatable article of food given the horse when you enter his stall is by far more effective in securing submission than loud shouting, cursing, whipping and the use of chain and other cruel bits combined.

To show the effectiveness of sugar in conquering an evil disposition I will cite one case that comes in my own experience. When the stallion The Seer came into my hands for training as a four-year-old he came to me with the reputation of being a very vicious horse. The morning I took him from the Stanley Bros.' Stable, Lewiston, Me., Mr. Stanley kindly enjoined upon me the necessity of watchfulness lest I get injured by the colt. That morning his groom had had a hand-to-hand duel with the colt, the colt having the call in the battle. On my way to the track I called at a grocery and bought two pounds of lump sugar, and ordered his new groom in whose charge he was placed always as he entered his stall to give the colt a lump of this sugar, and never to scold or whip him. I followed the same course, and it was not long before this heretofore vicious horse manifested the greatest delight when either of us entered his stall. I never had occasion to strike this horse while in my possession, and never saw him in temper.

I would enjoin upon owner and groom never to punish the stallion when they themselves are in temper, and if this injunction is followed I will wager a good hat that it will be a long day before the stallion is punished. Always remember that a mad man is an unreasonable instructor; that it requires our best judgment with full control of all our faculties to teach successfully.

The next question to be considered is that of food and water. The horse should always have a reasonable quantity of hay and grain; feed at regular hours, three times a day is sufficient. Care should be taken that his water is pure, and it should always be given before eating. The giving of large quantities of water immediately after eating distends the stomach, tends to inflammation and indigestion. Large quantities of water should never be given at a time.

Clean herdsgrass and oats should form the basis of food, the quantity of oats to be determined by the condition and requirements of the horse. An occasional feed of corn is not objectionable in this cold climate. A bran mash, consisting of three parts bran and one part oats, scalded together, with a tablespoonful of salt added, and allowed suitable time to cool to about blood heat, should be given twice a week. A feed of carrots, or small feed of potatoes, may be given with good results, but never feed turnips, as they are productive of skin humors. Nine quarts of oats or its equivalent in grain, with ten pounds of hay to the adult horse, per day, is about what feed he requires during the winter months. This feed implies that the horse has plenty of exercise.

I think all stallions should have regular exercise during the winter, say from six to eight miles per day in suitable

Digitized by Google

weather. Good health depends as much upon exercise as upon care and food. His exercise in general should be moderate, but if at times the horse is anxious to extend himself, and it would be safe, let him step along, as no evil results will follow such treatment. I would recommend feeding a small quantity of hay after the horse comes in from his work, as this serves to allay any nervous excitement, and makes the horse more contented and quiet. Hay should always be given in the morning before feeding grain, and the largest feed of hay given at night.

The stall must be in keeping with the sanitary condition of the horse. It is not presumed that every stallion can enjoy the palatial apartments provided for Arion; but every person who keeps a stallion for service should provide a comfortable, light, well-ventilated stall for his horse. The warm rays of the sun with pure air comes cheap (there is no royalty on these articles), and they are indispensable to health. I am much in favor of a stall so arranged that the horse can stand during the day upon some substance conducive to the active growth and health of the foot. A day stall arranged with a layer of six inches of ground hemlock bark I have found of great advantage to the feet and legs. The tan that has once been used by the tanner is equally as good, and can generally be secured at a small expense.

Good clean straw is as good or better than any other article I have ever used for a night or sleeping stall. The practice of ventilating the stall in front or over the head of the horse should never exist, for thereby the horse is exposed to draughts of air which is liable to produce inflammatory troubles. Ventilation should be secured in such a way that the horse is not exposed to draughts of air. It is not necessary for me to say that the stall should be kept perfectly clean. A very ancient maxim that "cleanliness is next to godliness" is not only recognized in the human but throughout the animal kingdom. Much care should be exercised to keep the stall free from all impurities. This also implies that the horse should be well and carefully groomed. The body, legs and feet should receive daily attention. The health of the horse depends very much upon his normal secretive functions. The pores of the skin and the issues of the legs serve as the conduit through which the impurities of constantly decaying nature escape; it, therefore, follows that every such avenue should be kept in the most healthy and active condition. The methods of grooming to be followed should be the least irritating to the horse. The body and legs can usually be kept clean with the rub cloth and brush, but I have found it necessary sometimes to resort to wash to remove the gummy, greasy substances that will accumulate upon the skin.

The feet of the stallion require special attention. They should be cleaned and washed every day, and as often as once a week a little fine salt should be applied around the frog. If allowed the tan stall this will be sufficient to keep the feet in a healthy condition. Too much clothing is objectionable, yet the horse should be kept reasonably warm. Bandages should not be used in the winter season unless some weakness of the leg exists. It is far better to rub the leg with a cloth until perfectly dry.

From the amount of exercise I have heretofore indicated, it follows that the horse should be kept shod. I would not advise this in all cases. I have sometimes found tips beneficial when the traveling would permit. The structure of the foot will determine this question. If the foot is inclined to excessive growth of the quarters, tips should be used, as thereby we obtain better frog pressure, which serves to expand the foot. The low quarter or flat-footed horse should always be kept shod.

There are a thousand and one minor considerations that enter into the winter care and management of stallions that might be detailed with profit, but the length of this article forbids that I further encroach upon your valuable space. It should be remembered that I have had continually in view the adult horse in writing this article, but the same general principles will apply to the colt, modified, of course, in the quantity of feed and amount of exercise to suit the age.—*American Horse Breeder.*

SIRE VS. DAM.

A FEW years ago it was quite the custom among writers on breeding topics to say of certain horses that they were "only brood-mare sires." The idea, as I understand it, was, first of all to assume that pretty much all the credit of the greatness of certain trotters should be given to the sire, and that the dams that produced the trotters were merely incidental factors. I have not seen the term used for some time, and it may be that with the accumulation of knowledge, justice is being at last distributed impartially, and the breeding world is prepared to give honor where honor is due. It has seemed for some time that we have been making a great mistake in ranging great trotters by the male line. The time has come for a new standard, a more scientific rule for classifying trotting-bred horses. The old standard has done its work, and has done it well. We can now see its imperfections with more distinctness, but it is easier to criticise what is than to suggest what may, with advantage, be substituted.

We have concealed from ourselves all along and persisted in ignoring what is now, with a greater accumulation of facts, made plain to our eyes, that our trotting pedigrees are really brood-mare pedigrees. Let us try, for the sake of understanding my thesis, to cut out from our memory all recollection of Messenger, Duroc, Diomed, Justin Morgan, and the rest, and replace their links in the chain of pedigree by certain brood-mares. The stallions, then, that descend from them figure as distributing reservoirs of the blood of these great mares.

Theoretically, sire and dam are equal contributors to the resultant foal. Practically one or another parent generally predominates in the offspring, and so far as trotting pedigrees and a steady march to excellence has been able to guide us, it has been a constant and triumphant march of female predominance.

Let us commence with Amazonia. Through her the Messenger line came into prominence as a source of high speed.

All the features by which Abdallah was distinguished from other sires of the Messenger line were distinctive of her, and a description of her is so strongly a description of him that the conclusion is that he was the son of her mother more than of her sire. She was a mare of great natural speed, and Mr. Helm says: "All accounts agree in saying that she was a trotter of the highest type, a road mare of great distinction; many say without an equal." He also says: "The essential peculiarities of form in Abdallah came from Amazonia."

The "essential peculiarities" of Abdallah, both in form and speed-giving power, mark him as one apart from his ancestors, carrying down, not the peculiarities of his sire's line, but the peculiarities of his dam. He sired a goodly number of progeny, not so many, of course, as to make the world enthusiastic for his perpetuation or regretful for his unseemly taking off, until the great deeds of his son recalled attention to him. Yet, strange to say—strange for the popular theories of descent—it is altogether probable that Abdallah would have remained without a mourner were he not mated with the Charles Kent mare. To make this assertion appear reasonable, I wish to draw the attention of the reader to the unmistakable fact that Abdallah was a most impressive sire. Not only did he impress his physical conformation, but still more his mental make-up. His seemed to be an organization of intense force, but without a governor. He was a horse of great determination, of great natural speed, but so ungovernable and so unreasonable to the approach of discipline that he was unbroken to his death. He transmitted to his descendants to the present generation, where they are not descended through Hambletonian, his own unreasonable sensitiveness, together with his high speed. We have a remarkable instance of this in Daniel Lambert. His progeny, like himself, are extremely sensitive, and, though endowed with greater reasoning qualities than the Abdallah line, they are in marked contrast to the other Morgan lines.

From Ethan Allen and Vermont Black Hawk he inherited his beautiful form, but Fanny Cook extinguished the Morgan balance and docile disposition.

Digitized by Google

Thus we have an Abdallah line covered with a Morgan skin.

What a contrast was Hambletonian. It was a great battle for supremacy that, when Abdallah was dethroned and the Kent Mare conquered. Just as Amazonia conquered the Messenger blood and implanted her personality on her descendants through her son, even to the present day, so the Kent Mare triumphed over Amazonia, and Abdallah lives today, not in the male line, but in the female line through the sons of his daughters.

The characteristics of Hambletonian are too familiar to every student to be repeated here. His great natural courage, his high speed, combined with an intellectual greatness and balance that made every desirable quality to be in the highest degree available, all these qualities show Hambletonian to be the son of Amazonia, but also, and in a far higher degree, the son of the Charles Kent Mare. So great was Hambletonian that we have not yet been able to say with confidence that his superior has lived or is alive, all things being considered. And yet the blood of Amazonia and the Kent Mare, already become in Hambletonian a mighty river, pushes it way onto greater accomplishments than the world has yet seen. Again and again has one or another of the self-conceited and self-enthroned autocrats of the trotting world set limits to the power of that potent blood, but the flood rushes on, sweeps down all barriers and the shouts of yesterday's triumph are forgotten in the far greater glories of to-day. At the present time men are less confident than ever, and a thought that I dreamed might come to pass is now boldly proclaimed as a thing highly probable, that one day the trotter and the runner will meet on equal terms for supremacy.

Although, I say, the greatness of Hambletonian has not been measured by any sire that has appeared since, and although the water above always helps to augment and make up the greatness of the stream below, yet we have come to a parting of the ways. The stream of greatness has been worthily borne on to another generation, and so worthily borne on, that not only has the quality continued to increase in luster, but the quantity in the collateral lines of Hambletonian's sons has been so abundant that the sceptre has passed from one to the other with a rapidity which renders prophecy futile and comparison impossible.

Yet how widely different are the sons. Great was Hambletonian; he was not great enough to make his sons Hambletonians. One of the first great stars in the Hambletonian firmament was Dexter. Dexter was so unlike his sire in form and temperament as to render possible an argument against the unimpregnable fact that Hambletonian was his sire. Dexter was the son of Clara. The owner of Dexter made a prophecy that if any horse ever beat Dexter's time it would be one bred like Dexter, thus bearing a well-earned tribute to the contribution of the dam's family. Yet another beat Dexter's time, and she was one as unlike Dexter in breeding, conformation and equipment as Dexter was unlike his sire. Alexander's Abdallah, so unfortunately and so untruly named, was the son of Katy Darling, a mare fully the equal of Hambletonian in speed and his superior in the match for supremacy, as she transmitted all his endowment with her individuality to Alexander's Abdallah, the sire of the conqueror of Dexter.

Anyone who has seen Lady Patriot in the flesh or has seen Schreiber's excellent photograph of her, can see at a glance where the Volunteer line gets its peculiarly fine finish. So strongly did this great mare impress her personality on her son and his line that of all the male lines descended from Hambletonian the Volunteer line is the strongest in the struggle with female influence for predominance. A son or daughter of Volunteer might easily be mistaken for a scion of his grandson, Jerome Eddy, and so it goes through nearly all the collateral lines.

One who has seen old Green Mountain Maid recognizes her predominance in the Electioneer line, not only in physical make-up, but still more in that natural irritability toward strangers which was so strongly characteristic of the daughter of Harry Clay and Shanghai Mary. This is all the more remarkable in a line so docile as the Hambletonian.

Digitized by Google

It is difficult when facts press on to pass them over that we may confine our article to reasonable limits. Hambletonian had many good sons. These did not all follow their dam. He had a number of sons that by the strictest test might be called great. These all differed from one another so much, and from their sire so much, that in their dams, and in their dams alone, can be found sufficient cause for their individuality. In Hambletonian can be found sufficient cause for the speed that any grandchild has ever shown, but let it be always understood that that grandson carries another's form and mold, different from Hambletonian's. We can all tell a Happy Medium at sight. The loose, easy swing, the great speed, the excellent legs, the lofty stylish carriage, and all tell us that Princess' progeny are passing. Along come the nervous, determined little offspring of the son of Clara. Are these Hambletonians? Yes, somebody answers, these are Hambletonians. Then come the leg-trotting, low-headed, machine-gaited Electioneers. These are Hambletonians, too, somebody suggests. Then comes another breed, their hind legs reaching out under the sulky, their rolling gait, their unequal conformation and size, renders it difficult to classify them without the gait. Yet somebody tells us that the descendants of Dolly Spanker are Hambletonians. The Volunteers, the Strathmores, each one so different from each other, and all so different from their sire's sire, are all Hambletonians. Our reason tells us differently.

Hambletonian and Mambrino are the classic names in the Messenger line. As in the line that produced Hambletonian, so the Mambrino Chief line is a broodmare line. If it had not been for the dam of Mambrino Chief, Mambrino Paymaster would have faded deservedly away from the pages of the trotting records. He is now remembered only as the sire of the produce of Mambrino Chief's dam. She produced three colts to Mambrino Paymaster, all of extraordinary speed, one only being kept whole, to the great profit of the breeding world. After a long summary of the evidence touching the breeding of Mambrino Chief, Mr. Helm, in his "American Roadsters," comes to this conclusion: "That the qualities of Mambrino Chief were due in large part, if not mainly, to his dam, has been regarded by those in any degree familiar with the subject as almost certain."

The greatest of the sons of Mambrino Chief was Mambrino Patchen. It is well here to copy Dr. Herr's description of the dam of Lady Thorne and Mambrino Patchen, that the breeder of experience may see if it recalls to his practiced eye any of her descendants: "The dam of Lady Thorne was raised and bred by William Rhodes, of Fayette county, Kentucky. She was a blood bay, 15½ hands high, with all the best characteristics of the thoroughbred about her, showing high quality at all points. Her legs and feet were like polished steel; she was beautifully proportioned and balanced; in her form no mixture of good and bad, large and small points, but, as stated, any one part admirably answering to the co-related part throughout.

Eyes large and perfect, carriage elegant, with excellent tail. Her regular trot seemed as though it could not be improved, so extraordinarily regular and machine-like were the movements. Stride level, elastic, open and her bottom of the best."

I venture to say that Mambrino Patchen is greater than any other son of Mambrino Chief, solely because he had a greater dam. And to show their certificate of greatness, the dam of Mambrino Patchen is reproduced in a larger number of her descendants than any mare that I can recall in the galaxy of great mares, unless we except Lady Patriot alone.

I need not prolong this overlong essay by citing all or even a part of the facts that are familiar to horsemen, that might be here introduced to confirm this theory of descent. My mind runs to Swigert, to Gov. Sprague, to Green's Bashaw, and many other horses that have brought obscure strains to prominence, solely because they had great dams.

It remains for me to note the conclusions to which breeding minds have reached:

Digitized by Google

First of all, we can not have great sires without great dams.

Second. Though we may have some success with poor dams and a good horse, we will have a thousand per cent. more success with good dams and sires of moderate merit.

Third. We might as well plant good seed in a desert and expect good results, as to breed good sires to dams without merit and expect to succeed.

Fourth. The art of breeding consists in mating great mares with great sires.

Fifth. The lesson of the past is that we should value a pedigree not by the great sires in the pedigree, but by the great dams.

Sixth. The first question we should ask concerning a horse to be bought for a sire is not "What was his sire?" but rather "What was his dam?"

Seventh. The habit of classifying breeds under their sires should be abandoned.

Eighth. Speed flows more uniformly through the female line than through the male.

Ninth. It is better to have one producer on the farm than twenty non-producers.

Tenth. If the mare has a producing dam, besides being herself a producer, she is worth two that are simply producers themselves.

Wishing all your readers a Merry Christmas and a Happy New Year, I hope it will be a year that will inaugurate more scientific methods. The vast accumulation of facts has enabled us better to generalize and to place a light to our feet that we may avoid the mistakes of the past. — "*Aurelius*" *in Clark's Horse Review.*

INFECTIOUS ABORTION IN MARES.

BY DR. THOMAS J. TURNER, STATE VETERINARIAN OF MISSOURI, IN "COLMAN'S RURAL WORLD."

In response to the Governor's letter of May 16, 1892, ordering me to visit the State of Montana and investigate a troublesome malady then affecting brood mares, especially of one Marcus Daly, of Riverside, Bitter Root Valley, Mont., I immediately started on said trip and arrived at the Daly ranch on May 24. An investigation was begun in a few days which required about four weeks to consummate, and I hereby tender you my report upon this subject, containing a history of the outbreak, its nature, and salient points pertaining to the proper management of the trouble, should it occur on any farm, also facts ascertained by experimentation, leaving out the more minute details concerning the parasite, which are yet to be determined by investigation.

Location of Daly Ranch.—The Daly ranch is situated in the fertile valley of the Bitter Root, in Missouri county, Mont. The grounds are generally high and well drained, the tillable land being in high state of cultivation. Much money has been expended on the property to make it a first-class breeding establishment; some thirty thousand acres are enclosed within its confines. The climate is perfect and feed first class, as also is the management. To diverge slightly from the object of this report, I am constrained to say that the location of the ranch, the soil thereof, nor the climate of the country has anything to do whatever with the cause of the malady.

The History of the Outbreak.—Infectious abortion (so called) was first manifest on the ranch, according to facts obtainable at that place, about the middle of February, 1892.

To preface the subject, it might be well to state that the malady, of whatever its nature, was causing the mares to slip their foals, either an abortion or a premature birth being the result. It was first noticed among the trotters of the Daly ranch; the renowned mare, Fanny Witherspoon, being the first to abort. This trouble ran riot through his entire stud of most valuable animals, both thoroughbred and trotters.

The first few abortions caused but little alarm, thinking they were the result of some accident. This being the case, the

Digitized by Google

mares known to have aborted were not regarded as especially dangerous to those still carrying foal, and were consequently allowed to pasture with them. Later, however, alarm was taken, but not until too late, for most all of the mares in foal had been exposed. The abortion continued until the last of May. Before I reached the locality the mares were constantly, as they aborted, removed from the ranch, and thus kept apart for two or three weeks. This was of an enzootic nature, no animals save those belonging to Mr. Daly being affected. thus it will be seen that this disease may be comparatively easily controlled, although both infectuous (?) and contagious (?). Concomitant with this abortion a few mares would carry their foals to nearly full term and then premature births would occur. Several foals lived, and apparently for a week or ten days were perfectly healthy, when at that period there would be noticed a swollen condition of the joints of the little fellows and a general dejection. The possibility of the same cause being in operation in producing the two maladies at once presented itself for consideration. Upon this general supposition the investigation in regard to abortion was made. The result will be seen in a history of the experiment.

Etiology.—At first the trouble was supposed to be caused by the food on which the animals were fed. Upon this suggestion investigations were made, but no agents likely to cause abortion were found. These investigations were made by botanists and men thoroughly capable of doing such work. They were employed by Mr. Daly, who has been extremely anxious to fathom the trouble and used all available means to do the same. He has spared no expense in doing so, and too much credit can not be given him for his kindly and generous aid to science in fathoming the cause of this malady.

Prior to this, however, it was supposed that the animals might be aborting from sympathy; then it was that those having aborted were immediately separated from the mares in foal. Mares and cows frequently abort through sympathy, and no infection exists. Upon arrival and prior to it, indeed, infectious abortion (?) was suspected, and the investigation begun with that idea in mind. Having arrived late in the foaling season, few mares were left to foal. This, however, was not a great disadvantage, for a few days after arrival a sorrel mare, Biddy Mac, running on a mountain range, gave birth to a foal, which, as far as external appearances were concerned, was perfectly healthy except that the little one was extremely weak. Being very young, however, no trouble was anticipated from this cause. In all these cases the fœtal membrane was always abnormal in appearance.

Appearance of Membranes when Found.—The membrane of this particular case when found in the morning after the labor, upon a hill-top, and close and minute examination made, revealed the following facts: That portion of the membranes accompanying the horns of the uterus, were found to be undergoing a decomposition, possessing a deep red, congested appearance; this followed by leaden, greyish color further on, and emanating a very saneous odor. There were also, in small patches, portions of the membranes entirely destroyed and small quantities of a muco-purulent matter to be found. From these membranes septic material was obtained for future use for experimental purposes. The method found hereafter in "History of Experiment and Results so far as Ascertained." The direct operating cause being a microscopical parasite, with its classification not yet definitely determined; the life, history of parasite and its habits have yet also to be determined.

Symptoms.—In this trouble, Infectious Abortion (?), no symptoms save those premonitory signs as a possible uneasiness noticed in simple abortion are noticed, and most frequently nothing at all is to be seen. However, in joint-ill, due to the same organism causing abortion as shown by investigation hereafter noted, affecting the foal which lived, the following symptoms are noticed: About a week or ten days after the birth of the foal there will be noticed a swollen condition of some of the joints of the limbs. These will increase in size and become very painful. They often rupture and

Digitized by Google

muco-purulent discharge will escape. Usually, however, there is no rupture but a continuous distention of the synovial sac. Upon a manipulation these swellings will be found very tense and feverish, the little fellow will have a most dejected look, will stand or lie down most of the time, moving around very little on account of the extreme pain caused by any motion, whatever. A severe synovitis at times partaking of a suppurative character is established and upon post mortem the entire epithysis will be found denuded of cartilage, so severe has been the suppurative action. The appetite seems tolerably fair in most cases, yet no thriving takes place, the hair looks dead and rough, the animal itself having little life and scarcely any vitality.

Course and Determination. — The mares after inoculation abort in about fifteen to twenty days. The foals that are born alive invariably die, though some live for two or three months.

Treatment Prophylactic.—In regard to the treatment of mares having aborted the following measures should be followed:

First—If the mare aborts in an open paddock or pasture the fœtus fœtal membranes should be burned and the mare taken to a stable or small lot where she can be easily treated.

Second—If removed to a stable it must be apart from any other stable containing pregnant animals, and must not be high ground, the urine of which will run into lots, paddock, or field occupied by pregnant animals. If removed to a small lot the lot must be lower than or in such a manner situated that no animals that are pregnant will by drainage be exposed to the germs causing the trouble.

(This third measure is only necessary in mares that have aborted and are not doing well.)

Third—The external part should be thoroughly cleaned with a solution of hydrargyrm bichloride (corrosive sublimate) one part to 1,000 parts of water. The tail itself should be thoroughly washed with same, or if it is in fly time a solution of carbolic acid may be supplemented for the corrosive sublimate of the strength of one part of acid to 1,000 parts of water. This having been done the vagina and uterus should be thoroughly cleaned with injections of pure tepid water. After this use the solution above mentioned for injections per vagina. Continue these injections once a day for two or three days.

Fourth—The attendant treating mares shall thoroughly disinfect his hands, and, if possible, change clothing before he goes into the presence of pregnant animals.

Sixth—The mares after treatment may be stinted with perfect safety to the stallion after two or three weeks' treatment.

Seventh—The foals affected with joint-ill, it being the same disease differently manifested and capable of producing abortion, should be destroyed and carcasses burned.

Eighth—If, however, the foal is let live it should be separated from pregnant animals, provided any of the swellings of the foal have taken on a suppuration, and an open joint or fistulous sore be the result.

Ninth—A mare, the dam of a foal suffering from the joint-ill, should undergo the same antiseptic treatment as though she had aborted, providing she is not doing well.

Tenth—Mares that have aborted and done well should not be stinted sooner than two or three weeks after the accident.

HISTORY OF EXPERIMENT AND RESULT SO FAR AS ASCERTAINED.

A few days after arrival at ranch, June 25, "Biddy Mac," a trotting-bred mare, gave birth to a foal. This, previously mentioned was very weak, and died in two days after its birth from starvation. A post-mortem was held, but nothing could be found to cause death. The udder of dam was then examined and no milk found. Cultures were made from the blood and several of the glands of the colt, to see, if possibly, it might contain any of the germs causing the trouble. It is not intended to give the result in detail, as many of the minute points were only tedious, and of no practical value to the general public.

Digitized by Google

Cultures made from blood of the foal we inoculated into pregnant mares to see if abortion would result. Cultures were also taken from the deceased fœtal mem branes from "Biddy Mac," and inoculation made therefrom. One bay mare in foal received the inoculation on June 6, on the following night she foaled. On June 29 the foal showed signs of joint trouble in right knee joint, and on July 1 the hock joint was as large as a man's head. Thus, from this experiment almost just begun, we might say, do we produce the disease in a colt that when born was apparently all healthy, that, too, after the inoculation had only been introduced a few hours. The mare, a dun, inoculated with a culture from Biddy Mac's colt on June 20, gave birth to a dead fœtal; this was an abortion as evinced by the deceased placenta, hence we see that from these two inoculations from a culture from blood of this colt we have produced both the maladies, abortion and joint trouble. The germs causing these two diseases are the same as shown under the microscope. That these two maladies are then one and the same disease differently manifest there is no doubt. Other and more varied experiments were tried and are still in progress concerning other matters with reference to the possible nature of the malady in regard to immunity and length of time of incubation after natural exposure. The investigation in these lines is not consummated, and much time and attentive work must be done ere the public receive any further statements.

From the foregoing it will be seen that antiseptic measures in way of washes, etc., in treating mares that have aborted, are not necessary, neither are they of any benefit, the germ causing the malady being in the system and not a local parasite; that strict sanitary measures are necessary; that medicinal treatment of whatever nature will be of no benefit as far as removing cause is concerned, or preventing the accident; that joint-ill and abortion are the same maladies differently manifest; that no local application to umbilicus of a recently born foal whose dam has been infected previous to foaling will not prevent the occurrence of joint-ill in colt.

The following facts may be by experimentation determined:

Whether one attack gives an immunity to another the succeeding year.

Whether we will or will not be able to vaccinate against its appearance.

What is the length of time required for incubation under natural or accidental exposure.

Whether or not the germ is capable of producing abortion save at certain stages in its life.

What is the length of time during which the germ remains in the animal economy.

Columbia, Mo., January 10, 1893.

Arab Lore.

BY ORRIN W. COOK.

THE great Sheik Abdulhed, traveling with a party of his warriors in the desert came across the trail of a smaller party of horsemen. From the direction of the footprints and other indications, Abdulhed and his men judged that the trail was made by a detachment of a certain hostile neighboring tribe. They started forthwith in hot pursuit, and soon sighted their intended prey. Shortly thereafter the pursued perceived the cloud of dust arising in their rear. The flight and the pursuit were fast and far.

At length Sheik El Jakkas, chief of the pursued party, said to his boy, "Thine eyes, O my son, are better than mine; tell me what horses yonder evil-minded ones ride."

The son, turning in the saddle and shading his eyes with his hand, looked long, and then replied, "O Defender of the Faithful, they be grey horses."

"Then," said El Jakkas, "we may as well stop and surrender, for we can not escape."

But even while this colloquy lasted, Abdulhed said to a youth by his side, "O heir of my life. thou seest as the eagle; tell me, on what horses are yon renegades mounted?"

The boy replied, "On chestnut horses, O Champion of the Prophet."

"Then we can never overtake them," said Sheik Abdulhed, and turned back a moment too soon to see the white signal

Digitized by Google

of surrender raised by the discouraged El Jakkas.

And thus, because two Arab tribes differed in their notions about the significance of horses' colors, this oriental narrative comes to a lame and impotent conclusion.

The Jewett Covered Track.

EDITOR MONTHLY:

I HAVE seen Naples, and am still alive! I have been to Niagara Falls, and didn't swim through the rapids, but I was in the great covered track at the Jewett Stock farm the other day and walked around the regulation mile course in just fourteen minutes by the watch, and I won't take off a second. At first I thought I'd never find the end, but a boy yelled to me to stop, and I was saved from going 'round and 'round, eternally, for I couldn't see any end! A person must see this monster building, 5,286 feet in circumference, all shingled, sided and painted, and as cozy within as could be desired, no matter how cold the weather without, to fully appreciate it. It is lighted by over 20,000 window panes, arranged in sashes that can be raised or lowered, to let in the fresh air of summer, and keep out the chilly winds of winter. And what a track! In condition for a battle between kings and queens of the turf every day. There is nothing like it in the world, that is certain. This is no fairy tale, but the truth, and I can't tell it all at that. The bicycle sulky came like a blessing, so has the covered track. Mascot, king of pacers, is being jogged six miles daily, barefooted, and his feet could not be in finer shape, on account of the flexible condition of the track. There are fully one hundred horses in training there, all ready for the early meetings in May. An animal goes away from this place in perfect condition, and can fight battles over rough tracks much longer than if prepared quickly in the early spring. His legs, tendons and muscles can stand a bruising campaign at a high rate of speed. I am not prejudiced, but firmly believe that no horseman or reinsman can afford to overlook this covered track. It is harrowed, scraped and rolled every afternoon from 3 until 6 o'clock to be ready for the "flyers" in the morning, and once a week it is practically plowed up by a specially arranged harrow. There is no rain to make the surface muddy, no sun to "bake it," no frost or ice to stop the wheels of progress. The trainers apartments are light and airy—all box stalls—provided with hot and cold water. The track has a series of small grades, the highest being thirteen inches in 100 feet, so that the horse can be gaited as desired, while the action of his muscles are changed at least six times in a mile—like different motions of an athlete handling dumb-bells. This conditions him for the battle of his life. A series of electric bells are arranged at the quarter posts, so that spectators sitting in the "grand stand" (capable of seating twenty-five), on the stretch, can ascertain the rate of speed at any place. Again, the water comes from actual springs, the atmosphere is intensely pure, and with the best of hay and grain, why shouldn't the candidates for track honors in 1893 look and feel like fighting cocks? William Andrews, one of the foremost of American trainers and drivers, said much in little, as follows: "I came here three weeks ago with thirty-two trotters and pacers. They have improved so rapidly that I can not believe my own eyes, hardly. It would be impossible to say too much about this mammoth enterprise. If Budd Doble, O. A. Hickok and other leading horsemen realized the actual benefits derived here, there would not be standing room."

Buffalo, N. Y. F. G. SMITH.

A 900-Year-Old Saddle.

THE picturesque little village of Payerne, in Switzerland, not far from Lake Neubourg, possesses a unique curiosity in the shape of a saddle which belonged to Queen Bertha, the founder of the Benedictine abbey, which has since been transformed into one of the best educational institutes of Europe. This saddle, which is more than 900 years old, is of a peculiar antique shape, having an aperture for the knee in the pommel. Queen Bertha was noted for her zeal and industry, and in order to set a good example to her subjects she always rode from one place to another to gain time.

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, FEBRUARY, 1893.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there has been no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1892, in two parts, $5.00. (Will not be sold separately.)

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9, 10 and 11, each.....$ 5.00
All in one order..... 40.00
INDEX DIGEST (of first 10 Volumes)..... 7.50

The Necrology of 1892.

THERE were not so many deaths of notable horses during 1892 as have frequently occurred in other seasons, but still when the end of a twelvemonth rolls around there is always a feeling of surprise at the proportions which the necrology column has attained.

In the way of sires that died last year Aberdeen and Masterlode, a couple of the best known sons of Rysdyk's Hambletonian, were without doubt the most prominent, although Sultan was also well known by reason of what his son Stamboul had been accomplishing on the turf and in the breeding ranks. There is more or less of interest in the unwritten history of each of these three sires. Aberdeen was bred away back in 1866 by Capt. Isaiah Rynders, of Passaic, N. J., an old man of strong convictions, furious temper when aroused, but whose friendships were as warm as his hate was vigorous and lasting. Although Aberdeen was foaled before the breeding of trotting horses had been systematically undertaken by any considerable number of people, Capt. Rynders had the right idea of how to go to work to get a trotter and a sire of trotters, because he followed the common-sense and natural law that like is very apt to produce like. He bred to Rysdyk's Hambletonian, at that time unrepresented in the 2:30 list, the famous trotting mare Widow Machree. She was a daughter of Seely's American Star, a mare of unflinching courage, and that her speed was far above the ordinary in the days when she appeared on the turf is evidenced by her record of 2:29. That Aberdeen was in his youth a very fast trotter is within the knowledge of many who knew the horse at that time, and that his record is only 2:46 is due wholly to the fact that he was never given an opportunity to reduce it to standard figures. Of what Aberdeen accomplished in the breeding ranks it is not necessary to speak at length, but more than one man who knew what a heart of oak there was in the dam of Aberdeen during her racing career has had confidence that the get of her son would not falter or fail to do their duty when it came to a hot battle down the homestretch. During the last year of his life Aberdeen was represented on the turf by the fastest of all his sons and daughters, the grand three-year-old trotter Kentucky Union, that made a race record of 2:13½, and by her numerous victories over good fields of youngsters stamped herself one of the best and most consistent performers of her age that the trotting turf has ever seen.

And in this connection it will not be amiss to call attention to the fact that this filly, the fastest of the get of Aberdeen, and as good a race nag as any stallion ever sired, had for her dam a developed trotter, the chestnut mare Kentucky Central, that had a record of 2:35, and a two-mile mark that is even more creditable. Kentucky Central was by Balsora, son of Alexander's Abdallah, and her dam was a daughter of Brignoli, 2:29¾, son of Mambrino Chief. It will be seen that Kentucky Central was bred in the same lines as are many of our best trotters of the present day, combining in direct currents the blood of Rysdyk's Hambletonian and Mambrino Chief. Therefore when she was mated with Aberdeen, a horse of marked trotting speed, and that was by Rysdyk's Hambletonian, and out of the 2:29 trotter Widow Machree by American Star, there was added to the already rich inheritance of the foal that was to come two more developed trotters, each one of which had a pedigree far

Digitized by Google

above the average horse of the time it was foaled. The concentration in one animal of two direct strains to Rysdyk's Hambletonian through such good sons of that horse as Alexander's Abdallah and Aberdeen, backed up by the great American Star blood through one of the only two daughters of that horse that made records of 2:30 or better, would in itself be a combination hard to excel or even equal, but when to this is added the Mambrino Chief strain through one of his sons that made a record better than 2:30, the combination is a difficult one to duplicate. Through Aberdeen, Brignoli, Mambrino Chief, and Alexander's Abdallah there are in the remote crosses of the pedigree of Kentucky Union a number of strains of thoroughbred or running blood, and as the filly herself is very racy in appearance it is fair to assume that in this respect at least she throws back to some of her remote ancestors, as neither her sire nor her dam was particularly fine in appearance. But both of them were trotters, just as were several other animals that figure prominently in the pedigree of Kentucky Union, and it is by reason of her developed trotting ancestors near at hand that she is enabled to beat 2:14 as a three-year-old. The total contributions of Aberdeen to the 2:30 list up to the present time are thirty-three in number, and his 2:20 list is:

Kentucky Union (3)	2:13½
Alabaster (4)	2:15
Hattie Woodward	2:15¼
Lycurgus	2:15½
Abble V	2:16¾
Treasure (p)	2:18¼
Jim Jewell (p)	2:19¼
Godelia	2:19½
Modoc	2:19½

In the second generation the Aberdeens are breeding on fairly well, although his sons have not accomplished as much in the matter of siring 2:30 speed as might perhaps have reasonably been expected from their generally excellent blood lines and individuality. The daughters of Aberdeen have produced fourteen performers that are standard by what they have accomplished as trotters, and, as was the case with Happy Medium, another distinguished son of Hambletonian, Aberdeen's history as a progenitor of trotting speed will undoubtedly read more brightly when those pages made since he was taken to Kentucky come to be reviewed. Already he has shown in the case of Kentucky Union that his blood nicks well with that of the class of mares to be found in the blue grass region, and, just as Happy Medium got Nancy Hanks after being taken from Philadelphia to Fairlawn, so did Aberdeen get his fastest trotter and most precocious descendant after he had been purchased as the companion stallion of Happy Medium at the farm that for so many years was conducted by the late Gen. Withers.

Masterlode, another of the prominent sires that died in 1892, was also well along in years, as the date of his foaling was 1868. He was bred precisely like Aberdeen, being by Rysdyk's Hambletonian and out of an American Star mare. James H. Mills, of Orange county, N. Y., who died at the age of seventy-seven in the last week of 1892, was the breeder of Masterlode. The stallion was at first called Hambletonian Star, and at an early age was sold to A. C. Fisk of Coldwater, Mich. There was a good deal of excitement and no inconsiderable amount of ill feeling raised toward Mr. Fisk when it was announced some months ago that after Masterlode had become impotent, and by reason of his age was also valueless for other purposes, the man who had for many years been his owner and who had profited greatly by the horse's valuable services as a sire of trotters, had disposed of the animal for a song to a man who finally turned him out to die of starvation and neglect. It was in this pitiable condition that Masterlode was found by a genuine horseman—one who had not the slightest financial interest in the stallion, but to whose God-given attribute of humanity and charity was joined a most creditable sentimentalism in matters connected with the horse. He bought Masterlode for a five-dollar note and saw to it personally that the few remaining days of the once famous stallion were those of comfort and ease. At the close of 1892 Masterlode had twenty-five trotters with records of 2:30 or better to his credit, and it is a notable fact that he never sired a pacer which became standard by performance. His daughters have produced ten standard performers, the only one of the lot having a record better than 2:20 being St. Elmo, 2:18¾. Masterlode had nine producing sons at the close of 1891, and in a general way he has done an immense amount of good to the trotting-horse interests of Michigan particularly and the country at large as well.

The 2:20 list of Masterlode is:

Belle F	2:15¼
Edward	2:19
Plush	2:19¼
George V	2:20

The fastest of these, Belle F., made her record in a race for the $10,000 Charter Oak stakes at Hartford, Conn., a race in which

Digitized by Google

she won two heats but did not succeed in capturing first money. Edward, the next fastest of the get of Masterlode, was quite a sensational horse in his day, becoming notorious by reason of the celebrated Edwin Forrest race at Utica, New York, in 1878, Edwin Forrest winning the first heat in 2:18, and Edward the next three in 2:20, 2:20, 2:21½. This race was so palpably an organized attempt to rob the public through the pool box that an investigation was set on foot which resulted in Dan Mace and Morrill Higbie, two of the best known drivers in the country, being "put on the ground," as they say on the running turf, for a year or so. After this episode in his career, Edward became famous as a member of the team driven on the road by Mr. Frank Work of New York city, and that made a record of 2:16¼ to pole, the other horse of the pair being Dick Swiveller, 2:18. In fact Edward and Belle F. were the only two of Masterlode's 2:20 list that possessed high qualities as campaigners or race horses.

Sultan, unlike Aberdeen, did not seem to be benefited, so far as siring speed was concerned, by a change of location, as it is unquestionably true that his fame diminished rather than increased after he was taken from California to Kentucky. He was foaled in 1875, and first came into public notice as the sire of Sweetheart, who was the first two-year-old trotter to beat 2:30, and right here it may be said, as showing the breeding-on qualities of the Sultan strain of blood, that Sweetheart reduced her record to 2:22½ as a three-year-old, and her first foal, Red Heart, made a two-year-old record of 2:26¼, reducing it this season as a three-year-old to 2:19. Stamboul has also been a great card for the Sultan blood, as for the last three years he has been a constant and dangerous competitor for the stallion record, his performances this season on the kite track at Stockton showing him (although rejected for purposes of registration) to be a trotter of extreme speed. More than this, Stamboul, who was foaled in 1882, has eleven trotters in the list, five of which are two-year-olds. Alcazar, another son of Sultan, has a record of 2:20½, and began siring speed at an early age, the first of his get entering the 2:30 list in 1889 as a two-year-old, her sire at that time being six years old. Alcazar now has five 2:30 or better trotters in his list, two of which are two-year-olds. Other sons of Sultan are getting speed, but the instances already noted are sufficient to prove him a horse of unusual capacity in that direction, and that this merit of his blood is not confined to one side of the house is evident when the fact is noted that his daughters have already produced eight performers that have made themselves standard by what they have done on the turf, among their produce being the trotters Muta Wilkes, 2:14¼, as a four-year-old; Glendine, 2:20; and Regal Wilkes, that held the two-year-old trotting stallion record with a mark of 2:20¾, reduced this to 2:17½ as a three-year-old, and in 1892 as a five-year-old obtained a bar of 2:11¾. This is a phenomenal showing in extreme speed production to be made by the daughters of a horse that was foaled in 1875, and as Sultan himself was a sire of early speed, it is certain that all his female progeny will be given a good chance in the breeding ranks, so that from now on their fame may reasonably be expected to increase instead of diminish. It was the late W. H. Wilson, whose name will ever be associated with taking George Wilkes from New York to Kentucky, who brought Sultan to the last-named state. The deaths of Mr. Wilson and the horse in which he had such great confidence occurred within a few weeks of each other, but the value of the Sultan blood is so well established and generally admitted by breeders and horsemen that it will be given every opportunity to figure even more conspicuously in the trotting annals of the future than it has in those of the past. A list of the notable deaths among trotting-bred stock in 1891 is given herewith:

Aberdeen, one of the best known sons of Hambletonian 10, and sire of Kentucky Union, one of the fastest three-year-old trotters of 1892	2:46
Acmon (p), by Nutwood	2:29¼
Administrator, son of Hambletonian 10, and well known as a sire of trotters	2:29½
Aiken's Hamdallah, by Hamdallah, dam by Alexander	2:21¾
Almont Star, by Almont, dam by Conkling's American Star	2:28¾
Amigo, by Electioneer, dam by Wildidie	2:16¾
Annie G. (first of the get of Dictator to beat 2:30)	2:28
Badger Boy, by Swigert, dam by Black Flying Cloud	2:26½
Bald Hornet (p), by Bald Hornet	2:21
Bessie F., by Athlete	2:29½
Black Bess (p), by Black Prince	2:26½
Bog Oak, sire of Frank B., 2:20	.....
Bryan Girl, by Glen Miller	2:26¼
Carrie Walton, by Governor Sprague, dam by Sentinel	2:23½
Cherry (p), by Hambletonian Mambrino	2:27½
Daily News (p)	2:30
Dame Winnie, dam of Palo Alto, 2:08¾, etc	.....
Deacon (p), by Ben Bolt	2:20¼
Diadem, sire of Dan D. (p), 2:15	.....
Ed Rosewater (p), by Vasco, dam by Vinco	2:16¾
Edwynne, by Bonnie Wilkes, dam by Louis Napoleon	2:30
Elsie Groff, by Danville	2:25
Emma Temple, by Jackson Temple	2:21
Evangeline, by Director	2:11¾

Digitized by Google

Fairest, by McCurdy's Hambletonian, dam by Messenger Golddust	2:18
Frankie H., by Spink	2:27¼
Fred Douglas, by Green's Bashaw, dam by Gale's Morgan	2:20½
Garfield, by Durango	2:29¾
Gen. Ewing, by Windsor, dam by Tullytown	2:27½
Gibraltar, sire of Homestake, 2:14½, and others	2:25½
Glendennis (p), by Almont Jr	2:17¼
Granberry (p), by Judge Salisbury	2:27
Great Western (p), by Saturn	2:25
Green River, by Principe	2:22¼
Grover S. (p), by Cafferty Horse	2:14½
Harry Noble, by Frank Noble	2:17½
Hattie Hawthorn, by Pate's Sentinel, dam by Hunter Lexington	2:23½
Huntsman, by Heptagon, dam by Virgo Hambletonian	2:30
Jassamine (dam of New York Central, 2:13½)	2:34½
Jewel C., by Kentucky Ruler, dam by St. Almo	2:24½
Judd Boy, by Marlborough, dam by Bajardo	2:29¼
Kate Agnew, by Hambletonian Chrisman, dam by Oakland Boy	2:28½
Kate Sprague, by Gov. Sprague	2:18
Kenoma (p), by Herod	2:23
Kentucky Jim, by Black Diamond, dam by Star Denmark	2:28
Kentucky Ruler, by Egbert, dam by Almont, (p 2:24)	2:29
Kit Carson (p), by Grey Dick	2:25½
Lakewood Prince, by Wilkesonian, dam by Woodford Mambrino	2:18½
Little Dick,, by Holabird's Ethan Allen, dam by Golddrop	2:24½
Lizzie Gibson, by Gen. Stanton, dam by Major Macon	2:29¼
Lucy (p)	2:14
Lynx	2:28
Lyle Wilkes, sire of five 2:30 performers	.....
Mambrino Kate, by Mambrino Patchen	2:24
Mambrino Medium, by Happy Medium, dam by Mambrino Champion	2:28½
Masterlode, son of Hambletonian 10, and sire of 25 trotters in 2:30 or better	.....
May Eddy, by Jerome Eddy, dam by Young Dick Taylor	2:25½
Midnight Chimes, by Chimes	2:16¼
Miss Q., by Wilkesonian, dam by Abdallah Mambrino	2:29¾
Miss Simmons, by Simmons	2:29¼
Nephew, sire of 18 with records of 3:30 or better	2:36
Neta Medium, by Happy Medium	2:22½
Pastime, by Lord Russell	2:27½
Palo Alto, by Electioneer	2:08¾
Parana, by Mambrino Hambletonian, dam by Hambletonian Prince	2:19¼
Presto, by Gen. Washington, dam by Jay Gould	2:19½
Prince Pilot (p), by Prince Pulaski	2:22½
Rarus, by Conklin's Abdallah	2:13¼
Reavis' Blackbird, sire of Vic H., 2:13¼	2:22
Red Brook, by Meadowbrook, dam by Col. Hambrick	2:22
Roy B., by Gilroy	2:24¾
Sallie B., by Young Jim, dam by Miller's Copperbottom	2:20
Sister, by Admiral, dam by Black Prince	2:19½
Sorrel Frank (p), by Nutwood	2:24½
Spinnella, by Louis Napoleon, dam by Dennison	2:21¾
Sport, by Piedmont	2:22¾
Star Maid, dam of Clayton, 2:19	.....
Strathso (p), by Strathmore	2:13
Sultan, sire of 28 trotters and pacers in 2:30	2:24
Templeton, by Warlock, dam by Happy Medium	2:25½
Tilton Almont, by Almont, dam by Clark Chief	2:26
Troublesome, by Messenger Duroc	2:25¼
Versailles Girl, by S. A. Douglas, dam by Tippoo	2:25¼
W. H. Bailey, by Vidette Boy Jr., dam by Delmonico	2:20¼
William H., by Messenger Chief	2:22¼
Young Watchmaker, by Watchmaker	2:30
Zilcaadi Golddust, sire of 3 with records of 2:30 or better	.....

Sires of Money Winners.

MR. F. S. GORTON, of this city, who is a breeder of the progressive sort and who believes that the demand of the hour is for money-winning trotters rather than for those which have extended pedigrees of meritorious blood lines, but which are apparently unable to live up to their ancestry, calls attention, in a communication in one of our contemporaries, to the fact, that when it comes to money-winning capacity the get of Director are making a wonderfully good showing. Here is his synopsis of the matter in regard to the four fastest of the get of Director:

Direct, to seven years old	$28,357.50
Margaret S., to four years old	20,284.25
Evangeline, to four years old	8,220.00
Directum, at three years old	12,657.50
Total	$69,469.25

It is unnecessary perhaps, to say that this amount of money could not in these days of active contest for first place among trotters and pacers have been won by the get of any horse unless they possessed extreme speed and the ability to repeat close to their fastest rate. Here are the records of the four horses named, a point which Mr. Gorton does not touch upon:

Direct (4), trotting	2:18¼
Direct (7), pacing	2:05½
Margaret S. (4)	2:12½
Evangeline (4)	2:11¾
Directum (3)	2:11¼

The average record of these four great money winners of Director's get is 2:10¼. This rate of speed ought to win a lot of money in any class, especially when it is on top at as early an age as was the case with the four horses named, all of them trotting to their best records at four years old or under, while Direct paced in 2:06 as a six-year-old, and reduced it half a second a year later. Looking at the matter in another light, we find that to the close of 1892 Director's 2:30 list numbers eighteen with records ranging from 2:05½ to 2:30, and that the average is 2:23½. This is certainly a remarkable showing for a stallion that was foaled in 1877, and it derives added luster from the fact that Director is the only sire of two trotters with race records better than 2:12, these records being also the last and winning heats in the races where they were made, and likewise race records for their ages, reference being had to the third heat of the three-year-old Directum, 2:11¼, and the fifth heat of Evangeline, 2:11¾, as a four-year-old, although it should be said that this latter performance was made in a postponed race, being the first heat trotted on the second day. The lesson to be learned from a study of these facts regarding the valuable qualities

Digitized by Google

which are inherited in such a marked degree by the sons and daughters of Director, is that the highest results in breeding are to be obtained only when blood lines that have produced eminent performers are blended in one animal, which animal possesses and exemplifies the best qualities of its ancestors both in point of racing ability and the power to transmit speed and staying qualities. Dictator, the sire of Director, is bred in the most fashionable lines that obtained at the time he was foaled, his sire being Rysdyk's Hambletonian and his dam a daughter of American Star that also produced Dexter, 2:17¼, the champion trotter of his day. In addition to being bred in good lines Dictator was also a fast horse, capable of showing a quarter in thirty-five seconds. Mated with a daughter of Pilot Jr., Dictator produced Jay-Eye-See, 2:10, at one time the champion trotter of the world. From a mare by Clark Chief he got Phallas, 2:13¾, a record that made its possessor the fastest trotting stallion in the world. From a daughter of Mambrino Chief that also produced Onward, 2:25¼, Thorndale, 2:22¼, and Czarina, 2:21, Dictator got Director, 2:17, and about the best racehorse trotter of his day, as in the $10,000 race at Hartford he beat the greatest field of trotters that had faced the starter up to that time, among the lot being Wilson, Fanny, Witherspoon, Phallas, etc. In addition to all this, Director was a horse that came to his speed early, trotting in 2:30 as a three-year-old and finishing the last quarter of the mile in which he obtained that record in thirty-five seconds. That under present conditions and fitted especially for a trial against the watch Director would have made a record close to 2:10, is the opinion of John Goldsmith, who drove the horse in most of his races, and who is not given to sensational or irrational statement. The merits of different sires and of the various strains of blood which go to make up the pedigrees of our most successful stallions may be determined by a non-partisan and unprejudiced resume of the trotting events of each season. It is inevitable that the best horses, to use an expressive phrase, "get the money," and it is becoming more and more apparent with each succeeding campaign that the stallions bred in strongest trotting lines and that themselves have been trotters of no mean repute are the ones that are taking the lead in the production of early speed, extreme capacity at the trot, and consequently, money-winning progeny.

Great Young Pacers.

A BOSTON paper which is partial to Diomed blood in trotting pedigrees, and which says that Nancy Hanks is forty-seven per cent. thoroughbred, contains in a recent issue the statement that "To Order (2:14), by Thistle (2:14), by Sidney (2:19¾), by Santa Claus (2:17½), shows up the developed-sire theory pretty well."

The Boston paper might have added that the 2:14 mark of To Order is the second best for a two-year-old pacer, and that the fastest record for a pacer of that age, 2:11, is held by Online, a son of the developed trotter Shadeland Onward, 2:18½; he by the trotter Onward, 2:25¼; he by the trotter George Wilkes, 2:22. It therefore appears that the fastest pair of two-year-old pacers that the world has ever seen are pretty much alike in respect of developed ancestry in the male line. In the case of Online it is three generations of trotters whose average speed as determined by their records is 2:21 11-12. In the case of To Order there come first two pacing records of 2:14, 2:19¾ respectively, after which there is a trotting record of 2:17½, the average being 2:17 1-12. It should not be forgotten, however, that Sidney, who stands in this pedigree between the trotter Santa Claus, 2:17½, and the pacer Thistle, 2:14, is about as intensely trotting-bred a stallion as it is possible to find, his dam being Sweetness, 2:21¼, by Volunteer, 2:37, second dam by Edward Everett; third dam by Harry Clay. The dam of Sidney traces twice directly to Rysdyk's Hambletonian and once to Harry Clay, which blood lines in combination have given us some of our fastest trotters, and as Sidney's sire was Santa Claus, a son of Strathmore, he by Rysdyk's Hambletonian, the intensity of the trotting inheritance of Sidney will not be questioned. He is a double-gaited horse and showed creditable speed as a three-year-old, but his natural inclination was for the pace, and he was therefore allowed to maintain that gait, at which, with very little preparation, he made a record better than 2:20. It is true that Thistle, the sire of To Order, had a pacing-bred mare for his dam, and it is likewise a fact that the dam of To Order was a pacing mare with a record of 2:20, so that under any circumstances it would be natural to expect both Thistle and To Order to make the pace their fastest means of locomotion. There is no intention to argue for or against pacing blood for pacers, or to contend that the trotting-bred pacer is

Digitized by Google

necessarily in any way better than a pacing-bred one, but it is of value and interest to now and then make some exposition of the facts concerning the pedigrees of noted performers at various ages, leaving such facts to produce their own deductions in the minds of readers. One thing is absolutely certain in the case of this pair of two-year-old pacers that have excelled in speed at that gait all others of their age—they are eloquent testimony as to the virtue of developed sires, and one of them, incidentally, does no discredit to developed dams, while the other is in a measure inbred to Hambletonian.

A Bonded Offer.

THE Fort Wayne Driving Club of Fort Wayne, Ind., is one of the best known and most reliable Trotting Associations in that State. Their fall meeting for 1893 will commence on September 11, and they offer for competition during the week ten stakes for Trotters and Pacers guaranteed to be of the value of over $10,000, entries to which close on February 1. That there may be no doubt of the money deposited as stakes and forfeits by nominators being on hand to be paid to the winners, the Secretary of the Club, H. C. Rockhill, has deposited with J. H. Steiner, Secretary of the American Trotting Association, a bond, of which the following is a correct copy:

KNOW all men by these presents that we, the Fort Wayne Driving Club, Samuel M. Foster, David N. Foster, Emmett M. Powers, Ronold T. McDonald, William H. Watt, Joseph W. Bell, Herman W. Tapp, Louis Wolf, Alfred D. Cressler, Willis B. Bash, Howell C. Rockhill, L. A. Centlivre, are bound unto J. H. Steiner, as Secretary of the American Trotting Association and to his successor in office, for the benefit of each, every and all persons that may be interested herein and who may deposit moneys in the hands of the officers of the Fort Wayne Driving Club for the purpose hereinafter mentioned, in the penal sum of twenty-five thousand dollars ($25,000) for the payment of which we bind ourselves, our heirs, administrators and assigns. Signed and sealed this third day of January, A. D. 1893.

The condition of the above bond is such that, whereas, the Fort Wayne Driving Club has advertised and will advertise what are commonly known as stake races to occur on the grounds and track of the said club at Fort Wayne, Ind., during their fall meeting in 1893, and various persons are expected to enter their colts and horses herein and pay entrance fees on account thereof;

Now, if such Club shall honestly and faithfully keep such money and use it only for the specific purpose and race that it is paid to it for, and not divert or use it for any other purpose or race than the one on account of which it is paid, and only pay it to the person entitled thereto in accordance with the terms of such races as advertised by said Club and the decision of the judges of such stake races, then this bond to be void, else in full force and effect.

The Fort Wayne Driving Club, [Seal.]
By S. M. Foster, President.
Samuel M. Foster, [Seal.]
David N. Foster, [Seal.]
E. M. Powers, [Seal.]
R. T. McDonald, [Seal.]
William H. Watt, [Seal.]
Joe W. Bell, [Seal.]
Herman W. Tapp, [Seal.]
Louis Wolf, [Seal.]
A. D. Cressler, [Seal.]
Willis B. Bash, [Seal.]
Howell C. Rockhill, [Seal.]
L. A. Centlivre. [Seal.]

We are acquainted with the signers of this bond and their financial responsibility, and know that they are entirely responsible for several times the amount specified.

CHAS. MCCULLOCH,
Pres. of the Hamilton Nat. Bank.
J. O. BOND,
Cashier Old Nat. Bank.

This is a step in the right direction to which we are glad to call attention.

In Reminiscent Mood.

TRINKET, that was purchased not long ago by Mr. J. Malcolm Forbes, is to be bred to Arion, 2:10½ as a three-year-old. It is this sort of selection and mating that will give us the race winners and record breakers of the future, and Messrs. Forbes, Moore and other enterprising breeders of the light-harness horse who have the means at hand to carry out their ideas to the fullest extent will reap the success which their foresight and enterprise deserves.

In her day Trinket was a champion, being the first four-year-old to make a record better than 2:20 at the trotting gait. This was at Louisville, July 10, 1879, and the other starters were Von Arnim, So So and Effie G., the latter being drawn after finishing last in the first heat, which fell to Von Arnim in 2:22, after which Trinket won in 2:23½, 2:20¾, 2:19¾. Two of the other three starters in this race also made records better than 2:20 later in life, the mark of So So being 2:17¼, while that of Von Arnim is 2:19½. So So was a wonder in her day, just as was Trinket, as two years before the latter set the four-year-old mark for trotters at 2:19¾ So So had electrified the trotting world by doing a mile as a two-year-old in 2:31, a hitherto unheard-of performance for a trotter of that age. But Trinket always held the George Wilkes mare safe in the matter of speed, retiring with a

Digitized by Google

record of 2:14. So So has shown, however, that she throws speed, something that can not yet be said of Trinket, although the latter's full sister is dam of a 2:30 performer. To the cover of Blackwood Jr., 2:22½, So So produced All So, 2:20¼.

Trinket and So So take the old-timers of the trotting turf back quite a bit, and visions of the trim little Princeps mare with her huge negro attendant, "Buck," black as night, arise. Trinket's sulky was painted a virgin white, and when Wiley Brasfield sat behind the McDowell entry he donned a white suit, so that the entire effect was both startling and pleasing. The old-timers recall the day at Cleveland when the nervy little man in the white suit jumped from Trinket's sulky at the finish of a heat and a moment later had struck big Mike Galvin of New York a stinging blow in the face in answer to something the Tammany man said. They remember also the race at Chicago in 1880 between Trinket and Maud S., the latter even then a star in the trotting firmament. Trinket would not trot a bit that day, and was way behind at the finish of the first two miles in 2:19, 2:21¼. Then distance was waived, and for the third heat Maud S. gave an exhibition of speed such as had seldom been seen at that day and set the race record at 2:13½. After this race at Chicago Maud wended her triumphal way down the Grand Circuit line, the only horse that beat her a heat being the grey gelding Charli e Ford owned by a dance-house keeper of this city.

The day previous to the race between Maud S. and Trinket, Charley Ford had been beaten by Hannis, the ugly-tempered little chestnut stud in Turner's stable. It was in the second heat of this race that Charlie Ford made his record of 2:16¾, the first being dead in 2:19½. The third heat fell to Ford, also, in 2:19, but when Hannis came back the fourth mile in 2:18¼ Ford was done so dead that Hannis beat him a long ways, the fifth heat, in 2:27, and jogged home far in advance for the sixth mile, in 2:23. "The Levee," as the disreputable quarter of State street is called, was turned inside out, financially, by the unexpected defeat of Charlie Ford, and many a sporty man had a crimp put in his bank account by that day's work that it took several long months to smooth out again. It was after this race that "Big Mike," the rubber of Hannis, did a trick that cost him his job. Hannis was as vicious a brute as ever saw a track, when the fit took him, and not safe at any time for strangers to approach. The victory over Charlie Ford made him famous in Chicago, and some friends of Turner who lived here were anxious to see the stallion. Turner promised to gratify their desire if they would come to the Lake Shore depot on the day the horse was to be shipped to Cleveland. They did so, and "the General," with the suavity for which he is noted, prepared to do the honors. After waiting until past the time when the horse should have arrived, without any sign of the animal, Turner became anxious, especially as he recalled the fact that Mike was in the habit of indulging in periodical lapses from the paths of sobriety.

The longer he waited, the more anxious Turner grew. Finally, coming calmly up Canal street amid a veritable maze of teams was Hannis, as chipper as you please. He was, to all appearances, making the journey on his own account, paying no attention to anybody and threading his way among the teams. But a second look disclosed the fact that at the end of Hannis's long halter—behind the horse, in truth—was Mike, stiff drunk. Turner is no coward, but his face blanched, and there was a lump in his throat as he realized what it would mean if Hannis got one of his mean spells. Somebody would be killed. So he started for the horse and was soon in command. Turner has often told the story, but nothing can make him believe other than that Hannis knew Mike's irresponsible condition, realized that for once the responsibility was all on himself, and resolved to make no false moves.

Likely enough this is so, because there is no question as to the intelligence of horses, especially the high-bred ones, and it is also true that a vicious horse is almost always above the average equine in point of reasoning power. A quarter of a century ago there was owned by George Mansur of this city, who for many years managed the old Dexter Park track, a trotter called Gen. Grant. He was as vicious a brute as ever wore iron, and it was the exception when his rubber did not have trouble with him. This groom, also, was a periodical drunkard, but when he would come to the track filled with liquor and throw himself in a drunken stupor on the straw of the horse's stall Gen. Grant would go to the farthest corner of the box and tremble with fear. He knew the man was in some mysterious way changed so that he was reckless in approaching the stallion, and this unconscious courage, which in his sober moments

the groom could not possibly assume, was his protection from an attack that would have ended in his death. Once the man was released from the thraldom of liquor and became wary of the stallion, the latter appreciated the fact and again asserted his supremacy.

As a rule trotters of the present era are far better tempered than were those of the days gone by. In the first place there is not so much of the eternal rubbing, bandaging, walking and general fussiness in connection with trotters that used to be such a feature of their life. Then a colt was not ordinarily broken until four years old, and the breaking process generally consisted of a fight, more or less prolonged, which the "colt breaker" won because of his superior command of artificial aids, and not because, as a rule, he knew more than the horse. Dexter was wicked, and so was Princess, a great long-distance trotter in her day, and dam of the stallion that sired Nancy Hanks. The dam of the present turf queen is by a brother to Dexter, and the little mare, as might be expected with these blood lines, is full of "gimp." Were ancient methods now in vogue the chances are that Nancy, Hanks would either have been ruined in "breaking" or in any event be dangerous at all times. Princess, the dam of her sire, would send a shower of kicks at the sulky the minute she was halted after a heat or exercise speeding, and Budd Doble has said that it would have taken only a little harsh treatment to have ruined Nancy Hanks, instead of leaving her splendid energy to be utilized in wonderful flights of speed.

About Great Brood Mares.

SOMETHING like twenty years ago Mr. Joseph Cairn Simpson, who has for a long time been prominent in trotting matters, both as a breeder, driver and writer, took to California a stallion named A. W. Richmond and his full sister, a mare called Nourmahal. The latter was a pretty good long-distance trotter, taking a five-mile record of 13:39. But being by a thoroughbred horse and out of a highly bred dam, she was inclined to be unreliable and not certain to stick to a trot when her spirit was roused.

From Nourmahal's breeding it was perfectly natural, and, in fact, inevitable that she should manifest this tendency to break into a run when matters became interesting, and yet the nerve force and spirit which lessened her value as a trotting performer was undoubtedly a valuable adjunct to her success when placed in the breeding ranks. She is already the dam of a trotter with a record better than 2:30, and her sister Norma is doing still better, having foaled Grandee, 2:28½, and Grandissimo, 2:23½. It is as brood mares that some of the half-and-half bred trotting mares of by gone days are establishing their greatest value, but even in this respect they do not outclass or even rank up to other mares that had more trot in their turf days, a more level head in races and a better trotting inheritance. For instance, among the modern generation of brood mares there is none that excels the trotter Mill Girl, 2:22½, by the trotter Jay Gould, 2:21½, as every one of her first four foals is in the 2:30 list, one of them becoming standard by performance as a yearling.

It is true that many of the greatest producing mares in the stud book had in their veins a large proportion of running blood, and by reason of this fact many people have been lead to believe that it was the running blood which made them great brood mares. The experience of later years does not bear out this idea, because our most notable producing dams of the present day are almost without exception strongly trotting-bred. For instance, there is Mabel L., the dam of four in the 2:30 list, and that was recently sold for $11,000. She is by Victor, 2:23, he by General Knox, 2:31½. The dam of Mabel L. is by Volunteer, 2:37, he by Hambletonian 10. Some of the greatest brood mares at Palo Alto, have no known thoroughbred blood in their veins. One of these, Mayflower, that produced Wildflower, champion two-year old trotter of her day with a record of 2:21, and Manzanita, champion four-year-old of her day with a record of 2:16, is a trotter with a record of 2:30½, and all that is known of her breeding is that she was by the pacer St. Clair, a horse of unknown pedigree, but, inasmuch as he was a pacer, it is safe to conclude that the thoroughbred element in his pedigree was not worth considering. Take for instance the mares that entered the Great Brood Mare table, in 1892, and select from them those that have three or more standard performers to their credit, this being done because lack of space, of course, prevents publication of the entire list at this time. There are twelve mares under this standard, and here are their names and the names of their sires:

Digitized by Google

Adele Tyler, by Chester, son of Rysdyk's Hambletonian.
Bay Hambletonian, by Rysdyk's Hambletonian.
Dalphine, by Harold, son of Rysdyk's Hambletonian.
Delilah, by Administrator, son of Rysdyk's Hambletonian.
Estabella, by Alcantara, grandson of Rysdyk's Hambletonian.
Fashion, by Curtis' Hambletonian, son of Rysdyk's Hambletonian.
Jennie, by Bull Pup, son of St. Lawrence.
Lady Forrester, by Royal George, 83.
Laura, by Billy Adams, great grandson of Rysdyk's Hambletonian.
Lizzie, by Wildidle (thoroughbred).
Nellie Lambert, by Daniel Lambert.
Rachel Ray, by Overstreet Wilkes, grandson of Rysdyk's Hambletonian.

Can any unprejudiced man deny that this is simply a phenomenal showing for the trotting-bred brood mares, and especially eloquent for the virtues of Hambletonian blood in the female as well as the male line? There has been a good deal of the glamor of lack of information and the thrusting forward of mis-information as to the qualities which made some of the great brood mares foaled a good many years ago achieve their eminence as producers of trotting speed. In the minds of many people the fact that a certain proportion of these mares had a good deal of thoroughbred blood in their veins was given undue prominence as a reason for their production of speed. The facts are that at the time the early generation of Great Brood Mares was foaled there were no established trotting families, and thoroughbred blood being the best was naturally and wisely established as a foundation. That this thoroughbred blood enabled the Pilot Jr. mares, for instance, to produce the extreme trotting speed is not claimed by many people, although it is held by a considerable proportion of those who have given the subject attention that a near cross of thoroughbred blood imparted better bone and sinew and consequently the ability to sustain flights of speed for a distance that would have been impossible had other blood been employed. This is unquestionably a tenable position, and it is also a rational one.

A Sharp Contrast.

THERE were two notable sales of trotting-bred stock during the month of January, both taking place in New York city and illustrating in a sharply defined way the influence which fashion has on prices when the public is the judge. The first sale was that of a considerable draft of horses from the Hickory Grove Farm, an establishment founded by the late J. I. Case and maintained by him until the time of his death. Phallas, who was the premier stallion at Hickory Grove, is a horse that not so very long ago shone resplendent on the trotting turf as an unqestioned champion of his kind; as his race record of 2:13¼, made in the fourth heat of a contest with a good field, far excelled in merit the 2:13¼ of Maxey Cobb, obtained about the same time, so that Phallas was generally and justly regarded as the best trotting stallion of his day. In the stud he has not been a brilliant success in point of producing extreme trotting speed, although that he has succeeded fairly well when 2:30 is the standard is shown by the fact that eight of his get entered the list last season alone. But he has still to produce a 2:20 or better representative and in the case of stallions that have been a sufficient length of time in the breeding ranks to be represented by a considerable number of performers, it is demanded by the public that they shall show the capacity to sire 2:20 speed as well as that of the 2:30 variety, if their blood is to command high prices at public auction. Suffice it to say that the buyers at the New York sale did not fancy Phallas himself, as he was bought in by Mr. Jackson Case for $4,100, only a tithe of the sum that could readily have been secured for him a few years ago. His sons and daughters sold at correspondingly low figures, and in fact it was only the brood mares with records that brought the money they were worth. On the whole the Case sale was a disappointment. Brown, a stallion that made a record of 2:18¾ as a four-year-old, when that performance was the best for an entire horse of his age, was disposed of for less than $1,400, although still comparatively young, and Sentinel Wilkes, a son of George Wilkes, was not valued at over $1,200. These prices were so remarkably low that to nearly everyone not familiar with the fickle fancy of the public in regard to blood lines they indicated something akin to a desperately poor condition of the market, but when the consignment from the Corbitt Farm was offered ten days later, it soon become apparent that plenty of money was forthcoming for trotting-bred horses if only their blood lines suited the fancy of those who wished to purchase. Mr. Corbitt disposed of sixty-nine head for a total of $105,510, an average of $1,529.13. Here is a list of the horses that sold for a thousand dollars and over:

Regal Wilkes, b s, 2:11¾, foaled 1887; by Guy Wilkes, 2:15½; dam Margaret, 2:23, by Sultan, 2:24; J. H. Shults, Parkville, Long Island $13,000

Vida Wilkes, ch m, 2:15¼, foaled 1888; by Guy Wilkes; dam by Nutwood, 2:18¾; Henry Pierce, Santa Rosa, Cal..... 9,600
Rupee, br s (p), 2:11, foaled 1887; by Guy Wilkes, dam by Poscora Hayward, 2:23½; W. R. Willets, Rosslyn, L. I..... 9,000
Lillian Wilkes, br m, 2:17¾, foaled 1886; by Guy Wilkes; dam by Langford; bred to Stamboul; J. H. Shults..... 6,000
Jay Wilkes, ch c, 2:35; foaled 1890, by Guy Wilkes; dam Sweetness, 2:21¼, by Volunteer; J. H. Shults..... 5,000
Ulee Wilkes, blk m, 2:23, foaled 1888; by Guy Wilkes; dam Sable, by The Moor; H. S. Henry, Morrisville, Pa..... 5,000
Lou Wilkes, blk m, 2:20¾, foaled 1889; by Sable Wilkes, 2:18; dam Hinda Wilkes; J. H. Shults..... 4,000
Brown filly, foaled 1892; by Stamboul, dam by Guy Wilkes; Henry Pierce, Santa Rosa, Cal. 3,600
Tabbie Wilkes, br m, foaled 1887; by Guy Wilkes; dam by Nutwood; bred to Stamboul; E. H. Harriman, Arden, N. Y..... 3,600
Alannah, b m (p), 2:11½, foaled 1887; by Guy Wilkes; dam by Winthrop; bred to Stamboul; J. H. Shults..... 3,500
Black filly, foaled 1892; by Guy Wilkes; dam Ruby, 2:19¾, by Sultan; J. H. Shultz..... 2,500
Sablehurst, blk c, foaled 1890; by Sable Wilkes; dam Gina Wilkes; W. Beckerle, Danbury, Conn..... 2,000
Adelia, b m, foaled 1889; by Electioneer; dam by Culver's Blackhawk; bred to Sable Wilkes; W. P. Kirk, New York City..... 1,950
Bay filly, foaled 1891; by Sable Wilkes; dam Glen Ellen; J. A. Goldsmith, Washingtonville, N. Y..... 1,950
Clio Wilkes, blk m, 2:30, foaled 1888; by Guy Wilkes, dam by Director; bred to Sable Wilkes; William Simpson, New York City.. 1,900
Millie Wilkes, b m, 2:26, foaled 1887; by Guy Wilkes, dam by The Moor; J. J. Quinn, New New York City..... 1,800
Bay filly, by Rupee; dam Melrose; Henry Pierce, Santa Rosa, Cal..... 1,600
Mcleay, blk c, 2:22¼, foaled 1889; by Sable Wilkes, dam by Nutwood; Martin Clark, Scranton, Pa..... 1,500
Chestnut colt, foaled 1892; by Guy Wilkes; dam by Arthurton; J. H. Shults, Parkville, L. I.. 1,500
Bay colt, foaled 1891; by Guy Wilkes; dam Ruby, 2:19¾; by Sultan; J. Gavin, Chester, N. Y..... 1,450
Brown colt, foaled 1891; by Guy Wilkes; dam by Arthurton; George Jacobs, Brooklyn, N. Y. 1,300
Black colt (brother to Regal Wilkes), foaled 1892; by Guy Wilkes; dam by Sultan; H. L. Wardwell, New York City..... 1,100
Leo Wilkes (brother to Ulee Wilkes); by Guy Wilkes; dam Sable, by The Moor; John Morrison, Jersey City, N. J..... 1,100
Black colt, foaled 1891; by Guy Wilkes; dam Atlanta, by The Moor; G. J. Hurley, Great Neck, L. I..... 1,000

Developed Mares as Dams.

DEVELOPED mares have made an extra good showing this season, both in respect to the number of their produce that have entered the 2:30 list for the first time and also in the way of accessions to the Great Brood Mare list. It appears that during 1892 forty-nine mares with records of 2:30 or better trotting, or 2:25 or better pacing, had their produce enter the 2:30 list and fourteen of these had previously had their produce become standard by performance, so that the mares are now in the Great Brood Mare table, although two of them, Beautiful Bells and Lucille Golddust had been there some time. These mares with records that were thus doubly honored in 1892 are given in the subjoined table, and their blood in the male line is also indicated through the names of their sires. The list is as follows:

Name.	*Record.*	*Sire.*	*No. in List.*
Adelaide	2:18	Milwaukee	2
Beautiful Bells	2:29½	The Moor	7
Bonnie Wilkes	2:29½	George Wilkes	2
Christine	2:29¼	Wood's Hambletonian	2
Elvira	2:18½	Cuyler	2
Katie Middleton	2:23	Mambrino Patchen	2
Kentucky Girl	2:28¼	Edward G.	2
Lucy (p)	2:14		2
Lucille Golddust	2:16¼	Dorsey's Golddust	4
Lady Foxie	2:24¼	Daniel Lambert	2
Lula F	2:29	Ericsson	2
Mill Girl	2:22½	Jay Gould	4
Portia	2:29½	Startle	2
Wildflower	2:21	Electioneer	2

Many of these mares were distinguished performers on the turf in their day, Adelaide being notable in this respect, as she began trotting as a three-year-old long ago, winning her races at that age and training on steadily until her mark of 2:18 was twice made in the same race against a good field of horses. Adelaide in addition to having a record had also the advantage, for a brood mare especially, of a great mother, as her dam also produced Milo, 2:21, that has one in the 2:30 list. Adelaide has thus far done everything as a brood mare that could possibly be asked for her, as to the cover of Bonnie McGregor she produced Adelaide McGregor, that entered the list as a two-year-old in 1891 and last season reduced her record to 2:20½. Her second foal was Adelaide Simmons, by Simmons, that has now taken a record of 2:23 as a two-year-old, so that in respect of producing qualities it would be difficult to find the equal of Adelaide, while it can not be truthfully said that any mare with her opportunities in the breeding ranks has done any better, as all her foals have become standard by performance at two years of age. It will be noted also in this connection that both of Adelaide's early trotting foals are by developed sires, Bonnie McGregor having a record of 2:13½, while Simmons has one of 2:28, and they in turn are by the developed sires Robert McGregor, 2:17½, and George Wilkes, 2:22, so that in these foals from Adelaide there is a wonderfully strong concentration of performing trotting blood on both sides.

Katie Middleton was also a good mare in her day, perhaps the best race-horse trotter that Mambrino Patchen ever sired. The old pacer Lucy, who came from Georgia to the North without any pedigree, but who proved the stoutness of her blood in many a hard-fought contest when the "big four" pacers were the attraction at the big meetings, and whose record of 2:14 was a star performance at the time it was made, is another one in the list. Her

Digitized by Google

foals that have beaten 2:30 are Lucyneer by Electioneer and the pacer Chris Smith by Guy Wilkes, so that Lucy shows good producing power in that she throws speed from different stallions, although, of course, they are two of the most notable sires in the country. Lucille Golddust is another that was a first-class campaigner before she became a brood mare. She was the star of the Golddust family, and as long ago as 1878 made a record of 2:16¼, and could put three heats in close to her best rate of speed. She has four representatives in the 2:30 list, two being by Young Jim, son of George Wilkes; one by Princeps and one by Governor Sprague. The fastest of her foals, Sprague Golddust, 2:15¼, is by the developed sire Governor Sprague, 2:20½, five-year-old champion of his day. Mill Girl was a fairly good turf performer, but her trotting career has been eclipsed by what she has accomplished in the breeding ranks, as every one of her first four foals is in the 2:30 list, one of them as a yearling. Wildflower was the two-year-old champion of her day, with a record of 2:21 and naturally could beat anything of her age in a race, as she had the Electioneer habit of sticking to a trot. The mares that have entered the Great Brood Mare list by having two of their get become standard by performance last season are four in number, as follows:

Name.	*Record.*	*Sire.*	*No in List.*
Dutch Girl	2:27¾	Abdallah Boy	2
Jeannie C	2:22	Nutwood	2
Maud (p)	2:20	Bertrand Blackhawk	2
Mattie	2:22½	Rysdyk's Hambletonian	2

The other mares with records better than 2:30 that had their produce become standard by performance in 1892, are:

Name.	*Record.*	*Sire.*
Alma	2:28¾	Rysdyk's Hambletonian.
Buzz Medium	2:20¼	Happy Medium.
Bonnie	2:25	Gen. Benton.
Blanche H	2:26¼	Blue Bull.
Bertie	2:27	Blue Bull.
Dixie Sprague	2:25¼	Governor Sprague.
Elaine	2:20	Messenger Duroc.
Economy	2:30	Echo.
Flora Wilkes (p)	2:19½	George Wilkes.
Fulton Maid	2:29¼	Clay Pilot.
Gazelle	2:21	Rysdyk's Hambletonian.
Lottie P. (p)	2:17¼	Blue Bull Jr.
Lowland Girl	2:19½	Legal Tender Jr.
Lady Rolfe	2:22¼	Tom Rolfe.
Lady Banker	2:23	Rysdyk's Hambletonian.
Linkwood Maid	2:20	Tripolitan Chief.
Lady Stout	2:29	Mambrino Patchen.
Lady Wilkes	2:29¾	Red Wilkes.
Lady Prewit	2:30	Clark Chief.
Manzanita	2:16	Electioneer.
Manon	2:21	Nutwood.
Madeleine	2:23¼	Rysdyk's Hambletonian.
Myriad	2:28½	Stranger.
Matilda	2:30	Nutwood.
Naiad Queen	2:20¼	Goodings' Champion.
Nerea	2:23½	John Nelson.
Nantilla J	2:30	Rockwood.
Rose Shipman (p)	2:23¾	Blue Bull.
Spanish Maiden	2:29¾	Happy Medium.
Wilksie G	2:22¼	Robert McGregor.
Yuba	2:24½	Harold.

An Uncalled-for Attack.

"Aurelius" asserts that the Registrar has interfered with the Stamboul matter (record), and that his interference "can be accounted for only in one way, and that is that Mr. Allen's interests should be conserved by the association over which he is president."

We will not be as unkind as some of his critics have been, and charge him with falsehood, but will *practice* the charity he *preaches*, and ascribe his misstatement to a lack of knowledge of the facts pertinent to the transaction.

The Registrar in no manner interfered with Stamboul's record or his sale, for the very simple reason that at the time no action of any kind had been taken, and his telegram to Mr. Kellogg was in answer to one from that gentleman, and did not even mention the name of Stamboul. On the face of the returns (report furnished by the National Trotting Association) the time performances at Stockton were manifestly irregular, and Mr. Kellogg was told that according to the reports received they would probably be rejected. As a stockholder in the Register Association, Mr. Kellogg was entitled to the information asked for, which was given him as fully as could be done in an ordinary telegram. If the telegram in any manner interfered with the sale of the great horse, Mr. Kellogg, or his principal, is alone responsible, as he made its contents public.

The inference of the gentleman that the Registrar prostituted his official position to further the interests of Mr. Allen is as untrue as it was uncalled for. "Aurelius" undoubtedly ascribed to the Registrar the motives that probably would have actuated him had he been called upon to act. He has so long worn a collar that he can not understand how a subordinate officer can possess the spirit of independence, and exercise his judgment in an honest manner.

Whatever Mr. Wiggins did or did not say, has no bearing on the case. The same investigation was made into the Nashville performances as was made into those which took place at Stockton, and resulted in a part of the performances at each place being rejected.

That the Registrar has no right to interpret the rules under which he conducts the business of the American Trotting Register Association, is too absurd to be noticed.

The executive committee of the board of

directors has sustained him in the position he has taken in all the rejected performances.

Proceedings of Executive Committee A. T. R. A.

CHICAGO, ILL., January 17, 1893.

PURSUANT to call the Executive Committee met at the office of the Association at 11 A. M., and was called to order by President William Russell Allen. Present: F. S. Gorton, L. Brodhead, M. J. Jones, N. J. Colman and C. F. Emery of the Executive Committee, also S. A. Browne, W. A. Sanborn, F. S. Waters and F. Rockefeller of the directors. The board was in session until the evening of January 18, and transacted the following business:

The case involving the pedigree of Manette, the dam of Arion, was taken up for consideration. Mr. Brodhead asked to be excused, and he took no part in the proceedings. Mr. Joseph Cairn Simpson represented the Palo Alto Stock Farm, and Messrs. French and Allen, witnesses on the other side, were present and examined.

Upon application of Joseph Cairn Simpson, it was ordered that the Arion case be continued until the first Monday in April, 1893.

Application of W. M. Kear, Van Wert, Ohio, for re-hearing of the case to establish record of the bay horse Joe Hooker and his son Jay Cooke. The case was continued until the next meeting of the board, and applicant directed to furnish a summary of the races in which the horses performed, and evidence to show the exact length of the track, and the exact distance it was lapped when the performances took place in 1874 and 1879.

Upon application of L. Brodhead, the pedigree of Sally Russell, grandam of Maud S., was taken up for investigation. The argument of Mr. Brodhead was read, and the evidence (including the Stud Book of Boston) submitted, was examined by each member of the board; the verdict was unanimous that the pedigree of Sally Russell, as it appears in the trotting register, is correct.

Application of the bay horse Byron Hill by Edge Hill 2766, dam Lady May by Pennsylvania. This case was continued from the last meeting of the board in order to enable the applicant to procure further evidence. Information having been lodged in this office that said horse Byron Hill was not out of the said mare Lady May, registration was refused. The evidence submitted to the board was satisfactory, and it was ordered that Byron Hill be registered as standard under Rule 6, and the number 21760 allotted him.

The Registrar submitted a report of the time performances made at Nashville, Tenn., October 18 to 22, inclusive, and asked for instructions as to acceptance by this association. Mr. Allen asked to be excused from acting in this case. It was shown that the time performances above mentioned were not made in accordance with the rules of this association, and the Registrar was directed to reject all time performances made at Nashville, Tenn., October 18 to 22 inclusive. All performances made over the kite track at Kirkwood, Del., during the August meeting, 1892, were rejected for records on account of being made on a down-hill track. The Registrar presented to the meeting a number of performances made at sundry places apparently not in conformance with the rules of this association, and asked for instructions from the Executive Committee. It was ordered that the performances, set forth by the Registrar and presented to the Executive Committee as not having been made in compliance with the rules of this association, be rejected for records.

Application of W. M. Kear for correction of pedigree of the mare Bertha, registered in the non-standard department of volume V, and also the application for the registration of Glen Miller Jr. and Ben Royse. It was ordered that the pedigree of the mare Bertha be corrected in accordance with the evidence, and that the application of W. M. Kear for the registration of Glen Miller Jr. and Ben Royse be granted.

Miller's Hambletonian 3465. Application of Registrar for cancellation of registration. It was shown that the above-named horse is not now and never was standard under the rules of this association. His registration was ordered cancelled, and the registration of all animals dependent upon him for standard rank also ordered cancelled.

Brahmin 13028. Application by the Registrar for cancellation of registration. It was shown that the pedigree as set forth in the application was a pure fabrication and fraudulent; the horse Brahmin not being by Mercer 8476, and that his dam was not Alice West, by Almont 33. The registration was ordered cancelled, the registration of all animals dependent upon him for standard rank also ordered cancelled, and the Registrar instructed to secure, if possible, evidence to show who is responsible for the fraud.

Digitized by Google

Clifton Pilot 2026. Application was made by the Registrar for the cancellation of registration on the ground that Clifton Pilot is not standard, not being the sire of Jack Lewis, 2:28½, upon whose record his eligibility to standard rank depended. The registration was ordered cancelled, and the registration of all animals dependent upon him for standard rank was also ordered cancelled.

Cicerone 13159. Application for correction of pedigree. In this registration the grandam was given in the Register as by Pacing Abdallah 6088. It was ordered that the pedigree be corrected to show that the grandam was by Redmon's Abdallah, son of Alexander's Abdallah.

Lady Jolly. Registered in volume IX. Application of the Registrar for the cancellation of registration on account of fraud. It was shown that this mare was registered by Dr. Dunlop, Alpena, Mich., and that the pedigree furnished by him was fraudulent. The registration was ordered cancelled.

Application made to establish the breeding of black gelding Ketch and bay gelding Sir Arthur. Messrs. Waters, Samuel Baker and Gorton were appointed a special committee to examine the evidence and report at the next meeting.

Black Rose. Application of Mr. Brodhead that the mare Black Rose, by Tom Teemer, registered as standard in volume IV, be cancelled and the mare be registered in the non-standard department of the Register. The application was granted.

Application of Francis A. Foster, Boston, Mass., that the Registrar be instructed to register the gelding owned by him called Wanderer, under that name. The application having been refused on account of the name being previously used. The application was denied.

The rule regarding the naming of horses was amended to include geldings.

The Registrar submitted a report of time performances at Stockton, Cal., October 13 to November 23 inclusive. The Stockton association was represented by its Secretary, Mr. H. H. Ashley, who asked that the case be continued. The following resolution was adopted: Moved, That all performances made at the Stockton, Cal., track from October 13 to November 23 inclusive, shall be rejected for records unless said association furnishes sufficient evidence on January 27, 1893 (the date selected by their Secretary), that such performances were conducted in accordance with the rules of this association.

There being no further business the committee adjourned to meet at this office Friday, January 27, at 10 o'clock A. M., or subject to the call of the President.

(Note.—The Secretary of the Stockton association having given notice that said association would not be represented at the adjourned meeting January 27 and had no evidence to offer, the time performances at Stockton, Cal., October 13 to November 23 inclusive, under the resolution adopted, stand rejected for records.)

"Is the Pedigree of the Grandam of Maud S. a Fraud?"

To the Executive Committee and Directors of the American Trotting Register Association.

GENTLEMEN: In the matter of the pedigree of "Sally Russell," the grandam of Maud S., this pedigree was first questioned by J. H. Wallace in an article in the April number of *Wallace's Monthly* of 1883; entitled: "Is the Pedigree of the Grandam of Maud S. a Fraud?" The occasion for the charge of fraud being the fact that in Bruce's Stud Book, Vol. 2, page 282, Sally Russell is recorded as being bred by Maj. B. Lucket, foaled in 1850, when the Stud Book of Boston for 1849 shows that Major B. Lucket did not breed Maria Russell, the dam of Sally Russell, or any other mare to Boston in 1849, so as to have an animal bred by him foaled in 1850, the presumption being that the Stud Book was correct in giving B. Lucket as the breeder of *Sally Russell.*

To save the time of the Executive Committee and directors.

1st. I will show that the Stud Book was in error in giving Ben Lucket as the breeder and owner of Maria Russell, and explain how this error may have occurred.

2d. I will prove the joint ownership of Capts. J. N. Holton and J. W. Russell in Maria Russell and other thoroughbred horses.

3d. That in the division of their thoroughbreds, Maria Russell became the property of Capt. J. W. Russell.

4th. That he bred this mare, Maria Russell, to Boston in 1849, and that in 1850 she had a chestnut filly.

5th. That this chestnut filly he named Sally Russell and sold her *himself* April 18, 1857, to R. A. Alexander.

I will ask the gentlemen to examine the

Digitized by Google

"written contemporaneous evidence" as presented, and verify it from the original.

Firstly, in the *Franklin Farmer* for 1837, published at Frankfort, Ky., is given a summary of races run at the Elkhorn track (four miles from Frankfort) at the "fall meeting," beginning November 1, 1837.

(Bound Copy of *Franklin Farmer* for 1837 submitted.)

"Summary—

4th day Sweepstakes for three-year-olds that have never won a race, $50.00 entrance, half forfeit.

B. Lucket, Holton & Russell's, b f Maria Russell, by Rattler, dam by Stockholder, 83 lbs	1	1
L. Sanders Jr., Burbridge & Harpers c c, by Kosklusco, dam by Moses, 86 lbs	2	2
S. T. Drane's b c, by Woodpecker, 86 lbs	3	dis

Time, 1 m. 52s—1 m, 57s."

In another race of this same meeting, Capts. Holton and Russell are recorded as starting a bay colt by Bertrand, dam by Tiger, etc.

The summaries are signed "B. Lucket, Secretary & Proprietor."

The summary of this race given in the "American Turf Register" of 1838, gives "B. Lucket's bay filly, Maria Russell," omitting to give Holton & Russell as the proper owners. It is presumable that the compilers of the Stud Book, finding Maria Russell recorded in Turf Register as raced by B. Lucket, concluded that he was her breeder, and so recorded it.

The summary of race given in *Franklin Farmer* and over Lucket's own name, is conclusive proof that he did not own Maria Russell in 1837. Confirmatory of this are the statements given below of various parties, that Messrs. Holton & Russell owned Maria Russell, that in the division Capt. Russell became the owner of Maria Russell. This ownership of Capt. Russell is further confirmed by the entry in the R. A. Alexander diaries, Exbibit "D," where he buys a filly foaled in 1850, bred by Capt. Russell, out of Maria Russell. If Capt. Russell did not own Maria Russell in 1850, how could he be the breeder of her foal? The evidence shows, quite conclusively, that the ownership of Maria Russell was continuous, first in Holton & Russell and then in Capt. J. W. Russell, and the Stud Book was in error in giving Ben Lucket as the breeder and owner of Maria Russell.

Secondly, the joint ownership of Holton & Russell in thoroughbreds is proven by the above summary of races in *Franklin Farmer*, by the statements of John M. Quarles (Exhibit A) and others.

Thirdly, the evidence that Capt. Russell became the owner of Maria Russell is established by the fact, as stated above, that R. A. Alexander's diary (Exhibit D) shows that he (Capt. Russell) sold a mare foaled in 1850, by Boston, as being bred by himself, and out of Maria Russell. Confirmatory of this is the testimony of J. M. Quarles (Exhibit A), Jessee Dillon (Exhibit B), and "The traditions" of the Russell family, as given in J. C. Russell's letter (Exhibit C).

Fourthly, the Book of Boston for 1849 shows that Capt. John W. Russell bred two mares to Boston in that year, and as Capt. Russell sold R. A. Alexander a chestnut filly, foaled 1850, by Boston, dam Maria Russell, the evidence is positive that one of these mares was Maria Russell. This written evidence is confirmed by the testimony of Jessee Dillon (Exhibit B), the statement of John C. Russell, son of Capt. Russell (Exhibit C), and the letter of A. G. Gresham (Exhibit F).

Fifthly, that this chestnut filly, by Boston, dam Maria Russell, by Rattler, was named "Sally Russell," is shown by J. C. Russell's statement (Exhibit C), and by entry in R. A. Alexander's Stud Book (Exhibit G).

The Visitor's Register, kept at the Stud Stable of thoroughbreds, shows that Capt. J. W. Russell visited that stable April 8, 1857. The presumption is that he came for the purpose of selling Sally Russell to Mr. Alexander.

The letter of Col. A. P. Churchill (Exhibit K), dated April 16, 1857, indicates that Capt. Russell got from him a statement of the pedigree to confirm his version of it.

The entry No. 3 (Exhibit D) shows that on April 18 Capt. J. W. Russell sold the Boston Mare to R. A. Alexander, and it is a fair presumption that Capt. Russell presented this letter from Col. Churchill, of April 16, as a credential of its correctness. On the back of this letter R. A. Alexander, himself, endorsed "Boston Mare, bred by Capt. Russell, cost $425," and filed it among his papers, giving the pedigrees of his stock.

Capt. J. W. Russell was a well-known character throughout Kentucky, was a frequent visitor at Woodburn, breeding a mare to Scythian in season of 1857, and it is ridiculous to suggest that some "irresponsible party," as Mr. J. H. Wallace charges, impersonated him, and sold a mare to R. A. Alexander. If an "irresponsible party" sold the mare to R. A. Alexander, how did this "party" get possession of a letter from A. P. Churchill, ad-

Digitized by Google

dressed to Capt. J. W. Russell, and presented to Mr. Alexander two days after? And how could this party induce R. A. Alexander to enter in his diary under several entries: "Mare, property of Captain Russell, of Franklin; got by Boston, Entry No. 1" (Exhibit D); "Boston Mare, *bred* by Captain Russell" (Entry No. 2, Exhibit D), and "B't Boston Mare, dam by Rattler, from Capt. J'o Russell," if Capt. J. W. Russell did not *own*, *breed* and *sell* this Boston Mare to R. A. Alexander?

In 1857 Capt. J. W. Russell bred Brown Mare to Imp. Scythian at a fee of $75. In R. A. Alexander's diary this is marked paid. Under the head of "Bills Payable," in 1857, is this entry, "October 6, J. W. Russell, Branch Bank of Kentucky, Lexington, $350." This note of $350 and the season to Imp. Scythian of $75, marked paid, explain the manner in which R. A. Alexander paid J. W. Russell $425 for Sally Russell.

The cotemporaneous written and printed evidence (independent of the statements made by reputable parties, which are given merely as confirmatory) prove that Holton & Russell owned Maria Russell in 1837; that Capt. Russell owned and bred her to Boston in 1849; that in 1850 she had a chestnut filly, afterward called Sally Russell, and that in 1857 Capt. Russell sold this mare, Sally Russell, to R. A. Alexander, of Woodburn Farm, for $425, with the pedigree now held by the family.

The links of evidence of a written kind are unbroken, and there has never been the shadow of a doubt of the correctness of the pedigree.

I have above reviewed the original charge of Mr. Wallace, made in 1883. Most of the evidence I have given was brought out in the newspapers at the time, and was considered so conclusive that Mr. Wallace was ashamed to bring it before the Board of Censors, but tacitly admitted its correctness, and from 1883 up to the time the *Register* was purchased from him, continued to register animals tracing to this pedigree, thus in his official capacity of Registrar, perpetuating what he now intimates was a "bogus" pedigree, when he had all the evidence before him, and the machinery of a Board of Censors in working order, before which the pedigree could and should have been brought for adjudication, had Mr. Wallace a particle of doubt as to its authenticity. After nearly ten years of silence, in the issue of *Clark's Horse Review*, December. 20, 1892, Mr. Wallace comes out in an article entitled "Historical Sources," and uses the following language concerning the pedigree:

"Closely connected with the pedigree of the dam of Pilot Jr. is that of Sally Russel, the grandam of Nutwood, Maud S., etc. These two pedigrees have been discussed to such an extent that I will certainly refrain from saying more than a very few words at this time. The whole question turns on an entry in Boston's Service Books for 1849, as follows: "John Russell's one-eyed mare." To make the pedigree of Sally Russell good it is maintained that this "one-eyed mare" was Maria Russell, and that she had passed from her breeder, Capt. Holton, to Capt. J. W. Russell. Now, Mr. L. Holton, son of Capt. Holton, says that Maria Russell was bred and owned by his father all her life, and that she died on the farm; that she never was bred to Boston, and that when she died she had two as good eyes as ever were in a horse's head. John W. Russell, Esq., of Louisville, Ky., a lawyer of excellent standing and character, told me personally that there was no recollection or tradition in the Russell family that the mare Maria Russell was ever owned there. He remembered his father's mare Mary Churchill, very well as the first animal he ever rode, and there can be hardly a doubt that this was the mare bred to Boston, in 1849. The mare Sally Russell was not sold to Mr. Alexander by Captain Russell, but by an irresponsible party claiming to represent him. If to these facts we add the additional ones that at thirteen she was brought into the sales ring blind, and so old in appearance that no one was willing to bid $5 on her, and again, when eighteen, she was led out without a single bid, and laid down and died two or three months afterward, apparently from old age, we have such an array of evidence as to leave no moral doubt upon the mind that the pedigree was bogus. Still, this good-for-nothing little blind mare, dying of old age when only eighteen, has been cited for years as the source of "extreme" speed. Why, that is just the age of Maud S., and she is to go into training to seize the world's record next year."

It is seen that he brings four witnesses, by which he pretends to prove this pedigree "bogus," asserting that in them "we have such an array of evidence as to leave no moral doubt upon the mind that the pedigree is 'bogus.'"

These witnesses are:

Digitized by Google

1st. Boston's Stud Book for 1849, which you have before you, in evidence.

2d. A *synopsis* of a statement made by L. Holton, which full statement is given in Exhibit "H," with a full retraction of it, which retraction Mr. Wallace does not mention (Exhibit I).

3d. A synopsis of an interview had by Mr. Wallace with Mr. J. C. Russell, a son of Capt. J. W. Russell, in regard to the "traditions" of the Russell family in relation to the pedigree. In Exhibit C is given a statement of Mr. J. C. Russell relative to this interview, positively contradicting Mr. Wallace.

4th. The appearance of Sally Russell when led into the sales ring in 1863 and in 1868. This evidence is too puerile to need comment, and I have never noticed it before, because of its weakness, and would not now but for Mr. Wallace's persistence in dragging it in as important.

The point he makes is that the mare was led into the sale ring and on account of her *aged appearance* there were no bids on her. This is entirely surmise on Mr. Wallace's part. At the early sales at Woodburn Farm, horses of all kinds sold low and on many animals no bids were made, when the best brought small prices. At the sale of 1860 no less than fifteen animals were passed for want of a bid, embracing all ages, sex and conditions, thoroughbred mares selling for $75, and fillies with trotting crosses as low as $50. At the sale of 1863, when there was no bid on Sally Russell, young thoroughbred fillies sold for $80 and $90, while two-year-olds and yearlings were passed without a bid and these with first-class pedigrees. At the sale of 1864 there were a number on which there were no bids, including, luckily for Woodburn, Canary Bird, afterward the dam of Harry Bassett. At the sale of 1868, the one it seems Mr. Wallace attended, the celebrated mare "Waltz" sold as a yearling for $117.50, and Alice Ward for $185. Thoroughbred mares as low as $75, and thoroughbred mares and foals by their sides as low as $85 each. Is it any surprise when young animals by such sires as Lexington, Australian and Asteroid brought low prices, that a blind mare eighteen years old, not in foal, and without a foal at her side, should be passed without a bid? This is on the presumption that she was put up at the sale. She was in the sale catalogue, but on the sale book used to record the incidents of the sale, etc., there is no memorandum recorded "no bid" opposite Sally Russell's name, and it is very doubtful if the mare was brought to the sale ring or offered at all. For the sake of argument, admitting there was no bid on the mare, Mr. Wallace's memory is a remarkable one to recollect so vividly an animal that he saw for a few seconds only. Mr. Wallace's practical knowledge fails to tell him two facts, that a mare eighteen years old, not in foal, looks a great deal older than the same mare in foal. (Every horseman understands this.) Again, a blind mare eighteen years old looks very much older than a mare of the same age with good eyes. Outside of this argument, the mare Sally Russell has been traced in the evidence given in this case from the time of her birth and her age fixed, beyond the shadow of a doubt.

Capt. J. W. Russell, a man of the highest character, is responsible for the utterance of this pedigree. The corroboration of it as he gave it, by printed and written evidence, is complete. If we fail to accept pedigrees so well authenticated we may as well burn all books of evidence. The personal honor and integrity of men is our only safeguard in the matter of pedigrees, in fact, in all the transactions of life, and to break down this trust would destroy human society.

Respectfully submitted,

L. BRODHEAD.

January 17th, 1893.

I wish to amend the above by submitting the Stud Book of Boston. It develops some important evidence that not having the Stud Book in my possession I had not observed.

The Stud Book shows that Capt. John Russell bred two mares to Boston. The first is "'No. 26.' Capt. John Russell, Pokahontas ensured—30." It is seen that this mare is named "Pokahontas." "May 26th, Capt. John Russell one-eyed mare by the leap 30." This shows that one mare is named, the other designated as "one-eyed-mare." As the proof shows that Maria Russell had but one eye and was bred to Boston in 1849, this is conclusive that the one-eyed mare was Maria Russell, and confirms Jesse Dillon and others. This is additional written evidence of the correctness of the pedigree.

L. BRODHEAD.

EXHIBIT A.

June 13th, 1883.

I, John M. Quarles, have been a resident of Franklin County for seventy-two years. I knew Capt. John A. Holton intimately (being a distant relative) and also knew Capt. John W. Russell well. I remember well a a Stockholder mare that was owned by them in part-

nership, having been presented to them by Mr. Shepard of Louisiana, and also a mare called Maria Russell by Rattler, out of the Stockholder mare. I also remember Vidoc, Swiss Boy and Mary Bell, all out of the Stockholder mare. I know that they owned this stock in partnership and had some of them trained. I knew Mr. Robert Taylor intimately and know that he bought Capt. Russell's interest in Swiss Boy. Robert Taylor was a son-in-law of Maj. Ben Lucket. It is my recollection that Vidoc was sold to Mr. Robert Sinclair and was carried to Missouri. I don't know exactly the time when the division of this stock took place, but I know that Capt. Holton afterward owned Mary Bell and did not have Maria Russell on his farm. I heard of Maria Russell afterward being at Capt. Russell's as one of his brood mares. JOHN M. QUARLES.

EXHIBIT B.

STATE OF KENTUCKY, FRANKLIN COUNTY.

I, Jesse Dillon, state that I am seventy-five (75) years old; am a resident of Franklin County, Kentucky, and have been all my life. In the early part of my life I lived with Mr. James Russell, deceased, and after his death with his son, the late Capt. John W. Russell, of this county, on his farm of about 500 acres, about five miles west of Frankfort, on Benson Creek, until his death in 1869 or 1870. I am now residing at that farm. I was Capt. John W. Russell's foreman on his farm from the time of his father's death until his (Capt. Russell's) death, by whose direction I carried his race mare Maria Russell to the residence of Mr. Ned Blackburn, in Woodford County, Kentucky, and bred her to the celebrated race horse Boston, returning the same day. Maria Russell had accidentally lost an eye and I was directed by Capt. Russell to be very careful with her. The next spring Maria Russell dropped a sorrel filly which Capt. Russell kept until she was six or seven years old, and then sold her to Mr. Robert Alexander, in Woodford County, Kentucky.

Attest:
A. MCDONALD.

STATE OF KENTUCKY, FRANKLIN COUNTY.

Before the undersigned authority personally came, Jessee Dillon, who, I believe to be respectable and credible, and subscribed and made oath to the foregoing statement, the same having been first read over to and explained to him by me before signing. Given under my official signature and Notarial seal this 28th day of April, 1883. JOHN B. LINDSEY,
Notary Public,
Franklin Co., Ky.

EXHIBIT B. (2)

Also came H. I. Todd, of Frankfort, Ky., who states that he is well acquainted with Jessee Dillon, and has known him for more than (40) forty years, and knows that said Dillon lived with the Russells, and that he was Capt. John W. Russell's foreman. Affiant was well and intimately acquainted with Capt. John W. Russell from the year 1839 until the date of his death, and was in his employ as clerk in 1839, and interested with him in various enterprises thereafter, and very frequently visited his house in Franklin County, and saw Jesse Dillon there on the farm in the capacity as foreman for Capt. Russell.

H. I. TODD.

Subscribed and sworn to before me by H. I. Todd, who I certify to be respectable and credible, this 28th day of April, 1883.

JOHN B. LINDSEY,
Notary Public,
[SEAL.] Franklin Co., Ky.

EXHIBIT C.

LOUISVILLE, KY., January 4th, 1893.

L. Brodhead, Esq.,

DEAR SIR: I have read an article in *Clark's Horse Review* from the pen of J. H. Wallace, in which he gives a purported interview with me in regard to the pedigree of Sally Russell, by Boston, the grandam of Maud S., in which he makes me say that there were no traditions in the Russell family of Maria Russell ever having been owned by my father, the late Capt. J. W. Russell. I remember perfectly the conversation had with him on this subject, in presence of Mr. R. S. Veech, and am positive I did tell him that the "traditions of the family" fully established the fact that Maria Russell was owned by my father; that she had a filly by Boston named for my cousin "Sally Russell," and that this filly was sold to the late R. A. Alexander. I told him that personally I had no recollection of any thoroughbreds owned by my father except Mary Churchill, I being too young to remember anything about Maria Russell and her produce, my only knowledge of her being from "traditions in the family," these traditions coming from my mother, my cousin, Albert G. Gresham, and the old negroes on the farm, more especially Jesse Dillon, who was my father's foreman and the man who delivered the mare to Mr. Alexander. They were all living at that time, and made statements to me of their personal recollections of the facts. I am certain, from the investigation I have made, and the "traditions of our family," that Sally Russell, by Boston, was sold to R. A. Alexander by my father, and not an "irresponsible party."

I am certain I impressed the above facts on Mr. Wallace in our conversation.

Very respectfully,
(Signed) JOHN C. RUSSELL.

EXHIBIT D.

COPIES OF ENTRIES FROM R. A. ALEXANDER'S DIARY FOR 1857,

Relating to purchase of mare from Capt. J. W. Russell, entered in the handwriting of R. A. Alexander, who was then proprietor of Woodburn Farm.

Entry No. 1. Copy.

"Mare property of Capt. Russell of Franklin
got by Boston
dam by Rattler (Thornton)
by Stockholder
Miranda by Topgallant
by Medley"

This entry is in pencil, under the head of "Memoranda."

Entry No. 2. Copy.

"Boston Mare bred by Capt. Russell
by Old Boston
1 D. Maria Russell by Rattler
2 D. Miss Shepherd, by Stockholder
3 D. Miranda by Topgallant by Dion
4 D. by old Diomed
5 D. by old Medly
6 D. by old Juniper"

This entry is found in the diary for 1857, and is in ink.

Digitized by Google

Entry No. 3. Copy.

"B't Boston Mare dam by Rattler fr'm Capt. J.'o Russell & sent her to Glencoe. She took horse (sent instead of Tranby Mare that slipped last year)"

This entry is found under date of Saturday, April 18th.

Entry No. 4.

Under entry of mares engaged to Imp. Scythian in 1857. "J. W. Russell Paid 35" The figure 35 is the No of the engagement in rotation.

Entry No. 5.

Under heading "Bills Payable" in 1857. The entry is "Oct. 6th J. W. Russell Branch Bank of Kentucky, Lexington $350."

EXHIBIT F.

I, Albert G. Gresham, now living in Indianapolis, Indiana, was born April 12th, 1836. I am a nephew of the late Capt. John W. Russell, of Franklin County, Ky. I went to my uncle's to live when 10 or 12 years old, and lived with him and since his death with his widow till about 1860, when I moved to Indianapolis. Having been raised by my uncle I was in a position to know his stock. I recollect that my uncle had two thoroughbred brood mares on his place when I was a boy, one was Mary Churchill, the other Maria Russell, a bay mare that had but one eye. Maria Russell had a chestnut filly by Boston, the only Boston filly on the place. This filly was named Sally Russell, was broken at two years old on the farm, and at three years old was sent off somewhere to be trained and returned that fall. My uncle allowed me to take the mare to ride when she was about four years old, and I rode her till she was sold to Mr. R. A. Alexander, of Woodford County, when she was six or seven years old.

I was a young man then, 20 or 21 years old, and recollect perfectly that this mare Sally Russell was by Boston, out of Maria Russell, and was sold to Mr. R. A. Alexander.

I am willing to make oath to the above statement.

A. G. GRESHAM.

To L. Brodhead, Spring Station, Ky., June 19, 1883.

EXHIBIT H.

FORKS, ELKHORN, May 24th, 1883.

This is to certify that my father, Capt. John A. Holton, was for a number of years interested with Capt. John Russell in a number of thoroughbreds, and they raced them in partnership. When they dissolved and divided the stock, I am positively certain that my father retained all the descendants of the Stockholder mare, among them Maria Russell and all her produce, and I know to my certain knowledge that said Maria Russell had two good eyes from the time of her foaling until the day of her death. If my father bred a mare to Boston, 1848, I incline to the opinion that it was a bay mare he owned called Limber, for the reason that she, Limber, was very uncertain, having missed several seasons. There is one point, however, that I feel very certain upon, and that is that neither my father nor Capt. Russell during their racing or breeding career ever owned a Boston filly. As Boston was the most famous horse of his time, it is not at all possible that there could have been a Boston colt or filly on my father's farm and I not knowing of the fact. I was born in the old homestead the 15th of November, 1820, and have resided either there or adjoining all my life; therefore I had constant opportunity to know all about my father's stock of horses.

L. HOLTON."

"I hereby attest that the above is my father's signature."

J. H. HOLTON, son of L. Holton.

Copy.

"FORKS OF ELKHORN, KY., June 11th, 1883.

Mr. J. H. Wallace,

DEAR SIR: In answer to your letter to my son, of May 31, 1883. The three points suggested (1st) in regard to her produce (Maria Russell's), I have no recollection, and, further, I have no data from which I could find out concerning them. (2) I have no remembrance whatever of her death, nor the manner of it. Now, in regard to the statement I made to Mr. John K. Stringfield, I think he has made it too strong, for I told him that my statement was from memory only, and that I could not nor would not swear to it. Since that time I have had sufficient proof to overbalance my memory, and circumstances recalled to mind that I am now convinced that I was in error. I simply stated what I believed to be true at that time, and in justice to all I correct my statement. I have no interest in the matter whatever, and only want to be understood. I insist that you will oblige me by publishing the above letter.

Yours truly,

L. HOLTON.

EXHIBIT K.

COPY OF A LETTER FROM A. P. CHURCHILL TO J. W. RUSSELL.

"FRANK, April 16th, 1857.

Col. J. W. Russell:

Your Boston mare was out of a Ratler mare and the Ratler mare out of a Stockholder mare.

The Stockholder mare was out of Miranda, a mare W. Sheppard presented to Capt. Holton. Capt. Holton informs me she was by Topgallant, the balance I do not recollect.

She is a thoroughbred.

A. P. CHURCHILL."

On the back of this letter is the address:

"Capt. J. W. Russell,
Capt Hotel,
Frankfort."

The letter was folded in shape for filing, and this memoranda in the handwriting of R. A. Alexander, written across the back.

"Boston mare
bred by Capt. Russell.
Cost $425."

Digitized by Google

I hereby certify that I am now and have been for many years intimately acquainted with the handwriting of the late R. A. Alexander, of Woodburn Farm, Spring Station, Ky.; that I have carefully examined the diaries of said R. A. Alexander, for the year 1857, especially the entries therein relating to the pedigree, breeding and purchase of the mare Sally Russell, by Boston; that I have also carefully examined the manuscript stud book of Woodburn Farm, and find the pedigree of Sally Russell therein recorded, and that the entries in the diaries and the manuscript stud book are in the handwriting of the late R. A. Alexander.

JOS. CAIRN SIMPSON.

Chicago, January 17, 1893.

At a meeting of the Executive Committee and other members of the Board of Directors of the American Trotting Register Association, under the By-Laws, we have heard all the evidence and testimony, and carefully examined all the exhibits in relation to the ownership, pedigree and the sale to R. A. Alexander by J. W. Russell, of the mare Sally Russell, as hereinbefore set forth, and we find the pedigree as registered to be proved beyond a doubt. It is therefore

Ordered: That the pedigree of Sally Russell remain as registered.

WILLIAM RUSSELL ALLEN,
F. S. GORTON,
NORMAN J. COLMAN,
C. F. EMERY,
MORRIS J. JONES,
FRANK ROCKEFELLER,
FRANK S. WATERS.

Dated at Chicago, Ill., January 17, 1893.

"The Records That Were Thrown Out."

The Breeder and Sportsman of California, in its issue of January 21, 1893, has the following editorial, which will commend itself to all unprejudiced persons:

"At the meeting of the Executive Committee of the American Trotting Register Association, which was held at Chicago on Tuesday and Wednesday of this week, they decided to throw out the trotting and pacing records made at Nashville, Tenn., from November 18 to November 22 for irregularities. The performances made up to the first-named date were accepted.

The Committee also decided to throw out as ineffective the performances made at the summer and fall meetings in Boston; Springfield, Ohio; Ponca, Neb.; Chillicothe, Ohio; Lansing, Mich.; Independence, Iowa; Albany, N. Y.; Newark, N. J.; San Jose and Vallejo, Cal.; Meadville, Pa.; Poughkeepsie, N. Y.; Holton, Kas., and at other points, on account of irregularities, claiming that they were not made in accordance with the rules of the American Trotting Register Association. The members of the Executive Committee present were: W. R. Allen, F. S. Gorton, Lucas Broadhead, M. J. Jones, N. J. Colman and C. F. Emery. In addition, there were present Directors S. A. Browne, W. A. Sanborn, F. S. Waters and Frank Rockefeller. Messrs. Broadhead and Allen did not take part in considering the records made at Nashville, where the great stallion, Kremlin, was interested.

This action of the Committee will cause a sensation among owners of trotters, and a revision of the tables of the stallions becomes a necessity.

The Committee's action may be criticised by a few, but to all fair-minded horsemen it will meet with approval. It is just as easy for horsemen and associations to hold their meetings according to the laws of the parent organization, as it is to hold them to suit the caprices or whims of a few owners of trotters who believe they can hoodwink the higher officials by getting up private matinees and never advertise them, but just have a few interested friends to act as judges and timers. The time for getting either time or race records under such auspices has passed, and we heartily endorse the action of the Committee for the stand they have taken. Who wants a record for a horse that will be looked upon as shady? The horse may have trotted every foot of the mile, but it can only be called a trial, and will have no standing, because the proper methods were not adopted to insure its being placed to the horse's credit.

The abolishment of time records as now made must come, and come quickly. A horse with a race record of 2:25 will always be considered better than one with a time record of 2:22, and at the next meeting of the Board the laws in regard to these "tin-cup" records must be revised."

* * * * * * * *

Owing to a misleading Associated Press dispatch, the editor of the *Breeder and Sportsman*, in common with many other persons, has fallen into the error of supposing that *all* the performances made at the places mentioned have been rejected. Such is not the case. Only a few animals are affected by the decision, except at Nashville, Chillicothe and Stockton. In many instances the animal making the rejected performance afterward reduced or obtained a legitimate record in compliance

Digitized by Google

with the rules of the Trotting Register Association, and the great majority of the performances were made in accordance with the rules, and have been duly accepted.

All performances against *time*, made at Nashville, Tenn., October 18, to October 22, inclusive; all performances against *time* made at Stockton, Cali., October 13 to November 23, inclusive; and *all* performances at Chillicothe, Ohio, whether made against time or in races have been rejected. The rejected performances will all appear in the *Year Book* as "rejected records;" the time made will be shown and will doubtless operate as a bar for trotting purposes in classifying horses for races.

The Stockton Performances.

THE Executive Committee of the American Trotting Register Association, at its meeting January 17 and 18, 1893, rejected all *time* performances made at the Stockton kite track, October 13 to November 23 inclusive, *provided* the Stockton society did not present evidence to the Board at its adjourned meeting, to be held January 27, 1893, showing that the performances were made in accordance with the rules of this Association. The adjournment was made upon the request of the secretary of the Stockton society, and the date fixed by him. January 24, 1893, the secretary of the Stockton society notified the Register Association that he could not furnish the required proof, and his society would not appear at the adjourned meeting, January 27.

The time made in the match races October 13, and October 27, has been accepted. Messrs. Allen and Brodhead took no part in the proceedings of the board when the Stockton performances were under consideration.

Value and Extent of Trotting and Pacing Races in 1892.

THE reports of the American and National Trotting Association for 1892 show that during the past year the membership of the two parent associations embraced nearly 1,300 societies, holding 1,525 meetings with 5,487 days of trotting and pacing, the first meeting commencing in January, the last ending on December 31. At these meetings $3,872,560 was offered in stakes and prizes for trotting and pacing horses. Add to this one-fourth in number and value for non-members, and the figures read 1,906 meetings; 6,858 days racing; $4,840,700 value of stakes and purses. That this estimate is below rather than above the actual total is shown by the fact that Part I of the Year Book for 1892 will contain reports of more than 1,900 trotting and pacing meetings of from one to thirty days' duration, and while very few members of the American or National Trotting Association have failed to report, it is known that quite a number of the county fairs and smaller non-association meetings are not included.

Notice of Annual Meeting American Trotting Register Association.

SECRETARY'S OFFICE,
CHICAGO, ILL., January 5, 1893.

THE annual meeting of the stockholders of the American Trotting Register Association will be held at the Auditorium Hotel, Chicago, Ill., on the 5th day of April, A. D. 1893, at 12 M., for the election of officers and the transaction of such other business as may be properly presented. J. H. STEINER,
Secretary.

Notes and News.

COLOR is a matter of fashion as well as of judgment. Away back in antiquity, in the time of Xenophon (B. C.), the Greeks preferred bay horses, and they thought a great deal of horses, as the sculptures on their noble buildings and their devotion to their classic horse races prove to us.

The Cleveland bay was a breed in England 200 years ago, and bay was the popular color in England. Until of late years we find that chestnut predominated on the British race courses. The majority of the great thoroughbred racers seem to have been chestnut. The following eminent winners, as well as many more that could be named, were of the popular chestnut hue: Eclipse and Pantatoon, who each had black spots on their hind quarters; Castrel, Selim, Rubens, Stockwell, Doncaster, Birdcatcher, Rataplan, St. Albans, Blair Athol Formosa, Hermit, Prince Charlie, Rayon D'or, and Bend Or.

Grey is not a popular color among breeders, but many grey horses have made themselves popular by their greatness. Nature does not contribute many white horses, whether they are liked or not. The same prejudice might exist toward them, as felt by the colored woman, who said of her mulatto child, that "she could not bar dat chile, 'cause he show the dirt so plain!"

Digitized by Google

The story will bear repeating, which is told

of an Arab shiek, who was flying from his enemies. Turning to his son, he asked:

"What horses are at the head of our enemies?"

"The whites, father," said the son.

"That is well," was the shiek's answer. "We will allow the sun to do its work. The power of the white horses will disappear before its rays as butter melts."

After a time, again the shiek spoke:

"My son, what horses are nearest our heels?"

"The blacks, father," answered the boy.

"Excellent," the old man said. "The stony ground will overcome the powers of the black, for even the negro of the Soudan becomes tired at the ankles when he walks over stony ground."

On they fled, until a third time the chief called upon his keen-eyed boy:

"What ones are now ahead?"

"The browns and the chestnut-browns, father."

"Then," cried the shiek, "we must fly faster, or we are lost. We can lose no time, for those horses can overtake us."

IN her interesting travels in Persia, Mrs. Bishop's experience with the saddle horses of that country may give us points on the effect of early kindness to horses and later care of them.

In the province of the Bakhbaris the colts are sold and the fillies kept, although there is not much encouragement to breed a good colt, for if a superior admires it he expects to get it as a present. They are shod with thin iron plates covering nearly the whole hoof and fastened by six big-headed iron nails. Raised in camps and among children, the foals are perfectly gentle and scarcely require breaking. They are sold at from thirty to forty dollars.

Mrs. Bishop's own horse, which cost twenty-five dollars, insisted on being petted and sharing her food, whether melon, cake or grapes, and would follow her everywhere putting his head under her arm or on her shoulder. She draws a handsome picture of the Persian horse, with his "sweet, intelligent eyes," who can be backed against any horse in the world for weight, carrying powers, endurance and steadiness, and who is to his rider a friend as well as servant. He wears in hot weather a shirt of fine wool, crossed over the chest, and over that a similar garment of coarser wool; and at night over all is put a piece of felt, a half inch thick, which hangs to the knees and extends from head to tail, secured by a broad surcingle. He is fed ten pounds of barley daily and as much as he will eat of straw cut in pieces an inch and a half long.

A MEETING of the members of the Western Southern Circuit for 1893 was held at the Victoria Hotel, Chicago, on Tuesday, January 24, to rearrange the dates of the circuit meetings. This was rendered necessary from the fact that the Northwestern Association of Trotting and Pacing Horse Breeders could not secure the use of the Washington Park track for the period first allotted to them, the club having promised the use of their ground in August to the World's Columbian Exposition. The rearranged dates are as follows: Sturgis, Mich., July 31–August 5; Grand Rapids, Mich., August 7–12; Fort Wayne, Ind., August 14–19; Independence, Iowa, August 21–September 2; Columbus, Ohio, August 21–26; Columbus, Ind., August 28–September 2; Chicago, Ill. (N .W. Breeders), September 4–16; Indianapolis, Ind., September 4–9; Mason City, Iowa, September 4–9; St. Joseph, Mo., September 18–23; Terre Haute, Ind., September 25–30; Evansville, Ind., October 2–7, and Nashville, Tenn., October 16–28.

THE Jewett Farm, Jewettville, N. Y., and Cheney, Kan., has adopted the plan of issuing to the patrons of their stallions a duplicate receipt for service fees; marking one very plainly and distinctly, "Duplicate for registration." This appears to be an excellent idea, and will frequently save trouble and delay in registration of the produce.

THE winter meeting of the Grand Central Trotting Circuit was held at the Murray Hill Hotel, New York, on Tuesday, January 24, with representatives present from the associations at Cleveland, Ohio; Buffalo and Rochester, N. Y.; Springfield, Mass.; Hartford, Conn.; and Philadelphia. A reorganization of the circuit was effected, Pittsburgh, Pa.; Detroit, Mich.; and New York city being enrolled as members. Dates for 1893 were arranged as follows: Pittsburgh, July 10–14; Detroit, July 17–21; Cleveland, July 24–28; Buffalo, August 1–22; Rochester, August 15–18; Springfield, August 22–25; Hartford, August 29–September 1; New York, September 5–8; Philadelphia, September 12–15. It was agreed on that these dates should remain practically unchanged for five years, and that no new members should be admitted without a two-thirds

Digitized by Google

vote of the circuit. Also agreed that each member of the circuit would offer stakes for two, three and four-year old colts, the aggregate amount of such stakes to be $75,000.

In speaking of the recent purchase of the famous stallion Ormonde by Mr. MacDonough, and of this gentleman's purpose to establish an extensive breeding farm with this peerless son of Bend Or and Lilly Agnes at its head, the San Francisco *Examiner* proceeds to show that at the high price of $150,000 which Mr. MacDonough paid for the horse, the investment was a good one from a commercial point of view, in support of which statement it very truly says: "Though $150,000 as the price of a horse will be a matter of world-wide wonder, it is easy to see that the purchase of a great sire like Ormonde, regarded as a business proposition, is likely to yield very handsome profits to an owner of sufficient capital. Twenty-five brood-mares of the highest grade could be secured for an average price of $3,000 apiece. This would add $75,000 to the cost of Ormonde, making a total outlay of $225,000, which, together with the cost of the breeding grounds and other expenses, may be put at $275,000. From this collection an annual return of twenty yearlings would be a reasonable expectation, and the sale of yearlings from a horse of far lesser fame than Ormonde's, namely from St. Blaise, has averaged $6,000 apiece. This would yield an annual return of $120,000, which, allowing for the current expenses of the ranch, would mean a return of at least 35 per cent. on the capital invested. Moreover, should the owner of such a ranch decide to race the produce of his stock at the present day he might be reasonably expected to make by stakes and sales $150,000 additional a year, with the opportunity to retain for his own ranch the most select of the sons and daughters of his sire, and thus be able, long before the demise of such a horse, to nominate more than one able successor to him in the stud."

"It would not surprise me at all," said one of the most prominent breeders in the United States to a *World* reporter "if George Gould should soon be on the turf with a big stable. George Gould has always had a fondness for running horses, and at Saratoga a few years ago he told me that it was only his father's opposition which prevented him becoming the owner of a big stable. His conversation showed that he had given much attention, and his knowledge of the different strains of blood and the performances of the leading horses of the turf was a great suprise to me."

A friend of young Gould's said that three years ago his father had to positively prohibit him from going on the turf. Jay Gould cared nothing at all for horses, and feared that George would neglect his enormous business interests in what he himself regarded as a pernicious folly.

Mr. Charles T. Luthy, Peoria, Ill., writes: "I have leased the track, with ample pasture grounds, heretofore occupied by the Melbourne farm, at Washington, Ill., twelve miles east of us, and have secured the services of Mr. A. P. Hanes, of Paris, Ill., the efficient driver, who has so successfully, this past season, through the Illinois Circuit, campaigned and driven to race records: Larry C., 2:19¼; A. P. (3), 2:26; Misty Morning, 2:26¾; Banner Bearer, 2:27¼; Nettie B., 2:27¼, etc.

A. S. Alexander, professor of veterinary hygiene at the Chicago Veterinary College, has lately been appointed to the office of Veterinary Hygienist at the World's Fair. As Mr. Alexander was an "honors" student under principal McCall, president of the Royal College of Veterinary Surgeons of Great Britain, and made a special study of veterinary hygiene under that distinguished teacher, his qualifications are unassailable. Horsemen will be interested to learn of this appointment.

Breeders' Meetings and Elections.

The Morgan Horse Breeders' Association of Illinois was organized at the Grand Pacific Hotel, Chicago, on January 2. The following officers and committees were elected: President, A. F. Moore, Polo; secretary and treasurer, Delos Dunton, Dundee; executive committe, A. F. Moore, Polo; A. W. Hinman, Dundee; C. M. Clay, Streator; F. W. Beardsley, Gibson City; M. E. Frank, Rantoul; A. Anderson, Fairview; J. C. Brunk, Springfield; A. Fowler, Lena. Committee to select specimens of the Morgan breed for exhibition at the World's Columbian Exposition: A. F. Moore, A. W. Hinman, A. Anderson. Committee to confer with the chief of the Agricultural Department World's Columbian Exposition: F. J. Berry, A. F. Moore, W. S. Keith. The president and secretary were empowered to issue a call for the organization of a National Morgan Horse Association at a suitable time and place.

Digitized by Google

The Eastern Ohio Trotting Horse Breeders' Association elected the following officers for 1893, at their annual meeting held at Alliance, Ohio, December 28: President, Emery Miller, Alliance; vice-president, Thomas Broth, Minerva; secretary, J. S. Karns, Canal Dover; treasurer, A. C. Naragon, Canal Dover. A number of trotting and pacing stakes were offered for the meeting of 1893, the time and place of which is not yet decided.

The following are the officers of the Maryland Breeders' Association for 1893: President, L. V. Baughman; vice-president, William F. Johnson; secretary and treasurer, Benjamin White; directors, W. Greenway, A. M. Christie, C. M. de Garmendia, Robert Hugh, E. B. Emery, C. Y. Maginnis, C. Hayward, W. F. Johnson, D. H. Rice, John Waters, J. C. McCoy, J. E. Phillips and G. O. Wilson.

Officers Lancaster County, Pennsylvania Breeders' Association for 1893: President, D. K. Burkholder; treasurer, N. L. Getz; secretary, J. D. Hartman; executive committee, James Duffy, J. L. Gingerich, J. W. Bruckart and S. A. Zeel.

The Nebraska Association of Trotting-Horse Breeders met at Lincoln on January 20. It was decided to incorporate the Society under the name of The Nebraska Association of Trotting and Pacing Horse Breeders. Capital stock $2,000. The following officers were elected for 1893: President, J. C. Kesterson, Fairbury; vice-presidents, D. T. Mount, Omaha, G. C. Smith, Nelson, and H. S. Reed, Lincoln; Treasurer, E. D. Gould, Fullerton; secretary, S. J. Briggs, Superior.

At the annual meeting of the Trotting and Pacing-Horse Breeders' Association of eastern Pennsylvania, held at Wilkes-Barre January 12, the following officers were elected for 1893: President, H. H. Harvey, Wilkes-Barre; vice-presidents, E. K. Meyers, Harrisburg, Frank Jermyn, Scranton; treasurer, John Laning. Wilkes-Barre; secretary, B. F. Killam, Scranton.

The officers of the New Hampshire Breeders' Association for 1893 are: President, W. F. Daniell; vice-presidents, Chester Pike and J. C. Norris; Treasurer, N. E. Martin; secretary, W. C. Clarke.

Volume XII.

VOLUME XII, American Trotting Register will be closed for admission of pedigrees on March 1. All persons desiring their animals registered in that volume must make application at once, and those whose incomplete applications for registration are now on file must complete the same before March 1, in order to secure insertion.

The Index Digest.

THIS work is one of the most valuable and popular of the publications of the American Trotting Register Association. No breeder, owner or student of the American Light Harness Horse can afford to be without it. It is an index of all standard and non-standard horses registered in the first ten volumes of Wallace's American Trotting Register, giving the name and number of all stallions, name and number of sire, dam and sire of dam, with complete reference to the volume in which they are registered. Mares and geldings are treated in the same general comprehensive manner. It is a valuable addition to the volumes of the Register, without which no set is complete. To such persons as can not afford a complete set of the Register, but merely wish to ascertain whether an animal is registered, or only desire the initial part of the pedigree, it is invaluable.

Bound in uniform size and style with the Register. Price $7.50, postpaid.

The Year Book, Volume VIII.

THE Year Book for 1892 is now well under way, Part I. being in the hands of the printers, and Part II. rapidly approaching completion.

The Year Book for 1892 will be published in two parts, price $5.00, and issued, if possible, about the middle of February; it will be a valuable and comprehensive work on the pedigrees and performances of the light-harness horse, a complete record of the most sensational year in the history of the trotting and pacing turf.

The first part will contain summaries of all authenticated trotting and pacing performances for 1892, with a complete index of places of trotting and pacing, and of performers' names and records.

The second part will contain

THE GREAT TABLES, VIZ.:

1. Alphabetical list of 2:30 Trotters in Harness.
2. Alphabetical list of 2:25 Pacers in Harness.
3. Table of 2:20 Trotters.
4. Table of 2:15 Pacers.

Digitized by Google

5. Table of 2:30 Trotters and 2:25 Pacers under their sires to close of 1892.

6. Table of Horses, Sires of two or more Dams of 2:30 Trotters or 2:25 Pacers.

7. Table of Great Brood Mares.

8. Table of Champion Trotters.

9. Table of Fastest Records.

The two parts will contain over 1,200 pages of valuable and authentic information in regard to the pedigrees and record of standard Trotting and Pacing performers to January, 1893.

These parts will not be sold separately.

Send in orders at once and avoid delay in receipt of the work when issued. The first orders received will be the first filled and sent out.

Our New Advertisers.

S. A. Browne & Co., Kalamazoo, Mich., announce in this issue their stallions for public service, also that they have for sale at reasonable prices colts and fillies by Ambassador, Warlock and Anteeo, out of mares in the Great Brood Mare list and with fast records. The Kalamazoo Farm has for years been in the front ranks of breeding establishments, and many fast and famous performers have been there bred and owned.

Ambassador 1496, 2:21¼, is the premier stallion, foaled 1875, by George Wilkes; dam Lady Carr, by the great brood-mare progenitor, American Clay 34; his breeding is strong and fashionable. He is sire of twenty-six 2:30 performers, five of them with records of 2:20 or better. Six of his sons have sired eleven in the 2:30 list, and two daughters are producers of 2:30 performers. Individually he is one of the grandest living specimens of the light-harness horse, taking the first premium a few years since at the Great Chicago Horse Show over one of the greatest rings of trotting stallions ever exhibited.

Warlock 3378, 2:33¼, is by Belmont 64; dam Waterwitch (dam of six in 2:30 or better), by Pilot Jr. 12; second dam Fanny, by Kirkhead's St. Lawrence. Foaled 1880, and with but limited stud service, Warlock is sire of four 2:30 performers, two of them with records made at three years of age.

San Jose 8737, foaled 1887, is young and comparatively untried in the stud, but his breeding is of the best; he is by Grand Sentinel 3865, 2:27¼; dam Josie Wilkes (dam of Wardship, 2:25½ at three years), by George Wilkes; second dam Josie, 2:30½, by Night Hawk. Eminent 17022, is by Ambassador 1496; dam Eminence, 2:18¾, by Empire 2378; second dam Soprano, by Strathmore (a great brood mare); third dam Abbess (dam of two 2:30 performers), by Albion. This grandly bred young horse was foaled in 1891, and was bred by the Kalamazoo Farm. The announcement of S. A. Browne & Co. merits the careful consideration of breeders and intending purchasers.

The Claireview Stock Farm, Claireview, Wayne county, Mich., presents a new advertisement on the outside page. They offer for sale "a few brood mares in foal," and guarantee them "tried and tested" and "no outs in any particular."

The merits of Jewett Farm and horses are fully set forth on other pages of this issue, but the advertisement of their breeding department at Cheney, Kas., is worthy the close attention of our readers and subscribers.

The announcements of South Elkhorn Farm, R. P. Pepper & Son, Frankfort, Ky., have been for years familiar to the readers of the monthly. But while the name of the great stallion, Onward, remains at the head, the figures are changed by the rapidly increasing number of his performing and producing descendants. Onward is one of the greatest sons of that greatest of trotting progenitors, George Wilkes. Seventeen years of age, he has now to his credit sixty-six 2:30 performers; twenty-nine of his sons have produced seventy 2:30 performers, and he has eleven producing daughters. Norval, 2:14¾, by Electioneer; dam Norma, by Norman, is at ten years of age sire of four 2:30 performers, and takes rank as one of the fastest and most promising sons of Electioneer. Madrid, by George Wilkes, dam Mercedes, by Belmont, is rapidly achieving success in the stud, and the close of 1892 finds him credited with nine 2:30 performers. Nutpatch, by Nutwood, dam Patchen Maid, by Mambrino Patchen; and Striker, by Onward; dam Cachuca, the dam of Catchfly, 2:18¼, are the other horses advertised for service, and are by breeding fully worthy of their distinguished and successful companions.

R. C. Estill, Lexington, Ky., offers for public service at a reasonable fee, one of the best bred and individually great sons of Electioneer. Electro Benton 15,027 has a three-year-old record of 2:24¼ and is credited with far greater speed than his record shows. He is a bay

Digitized by Google Copyright

horse, foaled 1889, by Electioneer 125; dam Nelly Benton (dam of three in 2:30 list), by General Benton 1755; second dam Rosalind, 2:21¾, by Alexander's Abdallah; third dam Burch Mare (dam of two in 2:30 list) by Parker's Brown Pilot. This pedigree bristles with performers and producers, fully warranting the assertion of his owners; that to breed to Electro Benton is to "breed to a stallion by a great producer, and out of a dam that is a producer of speed."

Among the oldest and best-known sulky manufacturers in the West is the establishment of C. Toomey & Co., Kansas City, Mo. They advertise in this issue a new improvement in make, and one especially adapted to the pneumatic tires; and accompany the announcement with a high endorsement of its value.

James F. Camp & Sons, proprietors of The Catalpa Grove Farm, La Porte City, Iowa, announce that they are breeders of Standard Bred Road Horses, Holstein Freisan Cattle, Shropshire Sheep, Poland China Hogs and Scotch Collie Shepherd Dogs.

In 1892, for the first time, the progeny of the great trotting stallion Axtell appeared on the turf to perpetuate and further distinguish the name of their sire. There were but three of them, and two, Elloree, 2:26, and Axle, 2:26¼ (each two years old), entered the charmed circle. The last named, Axle 5183, is in this issue advertised to make the season of 1892 at Terre Haute, Ind., in charge of Budd Doble, and at the reasonable fee, considering his breeding and early performance, of $150. Axle was foaled 1890, by Axtell 5183, 2:12, dam Cora Ettie by Adrian Wilkes 6560; second dam Mambrino Queen, by Mambrino Patchen 58; third dam Flora, by Alexander's Edwin Forest 49; fourth dam by Grey Eagle. In the advertisement a full description of the horse is given, and the opinion of Budd Doble as to his value and prospects on the track and in the stud. His owner, A. C. Bruce, also announces that Arcadian 2687, 2:23½, by Egbert 6561, dam Laura by Almont; and Herbert 6561, by Adrian Wilkes, dam by Mambrino Abdallah 2201, will make a season at Minneapolis, Minn.

D. C. Taylor, Kankakee, Ill., offers for public service three highly-bred trotting stallions, viz: Wilkesward, Bonanza King and Princet; and the breeders of central and northern Illinois, especially those in Chicago and vicinity, should give them a liberal patronage.

Wilkesward 17306; three years old; record 2:18½, is one of the best bred, and, age considered, fastest sons of Onward 1411 (sire of sixty-six 2:30 performers at seventeen years of age). His dam is Lula Harold, by Harold 413; second dam Lulu Patchen, by Mambrino Abdallah 2201; third dam Big Queen, by Mambrino Boy 844; fourth dam by Bourbon Chief 383; fifth dam by Gill's Vermont 104. Lulu Harold is sister of Alturas, 2:12½, also dam of Wilkesward, 2:18½, and Lulu Wilkes, 2:26½, at two years old; and Lulu Patchen is dam of Alturas, 2:12½, at four years old; thus giving Wilkesward two producing dams. Bonanza King 21895 is also by Onward 1411; dam May Queen by Legal Tender 1784; second dam Queen of the West, 2:26¼, by Pilot Jr. 12, and Princet, the last of Mr. Taylor's trio, is by Princeton 2578, 2:19¾; dam also May Queen. Mr. Taylor sets forth the pedigree of another stallion owned by him, Norville 21198, by Norval 5335, 2:14½, dam Lulu V., by Vanguard; second dam Lulu Harold, above noted; but announces that the colt will be trained in 1893, and not allowed to serve any mares.

William Stahl, Quincy, Ill., an old patron of the advertising columns of the MONTHLY, again calls attention to his device for spraying trees and vines.

The enterprising proprietor of Tuscarora Farm, C. M. De Garmendia, Doubs, Md., makes his announcement for 1893, in this issue, setting forth the merits and terms of service of three highly bred stallions, Sea King, Monocacy and Tuscarora.

Sea King is by Lord Russell 4667; dam Fairy Belle (a "great brood mare") by Belmont 64; second dam Waterwitch (another "great brood mare), by Pilot Jr. 12; third dam Fanny, by Kinkead's St. Lawrence. This pedigree is rich in producing dams, and as Sea King is as good individually as by breeding, he is certain to prove a successful sire. Monocacy, by King Wilkes 1867; dam Vivandiere, by Volunteer 55; second dam Martha, by Abdallah 1; third dam, by Conklin's Bellfounder, is not only well bred, but a fast and game race horse, with a race record of 2:21½, 2:21¾, 2:23. Tuscarora is by (Tuscarora) Sea King 11775; dam Duenna, by Woodford Mambrino 345; second dam Dahlia, by Pilot Jr. 12; third dam Madame Dudley; another pedigree with producing dams close up. The Tuscarora Farm has choice young stock for sale and will send catalogues on application.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ALLIA, (7) br m foaled 1892; by Tintinnabulum 12644; dam Madam, by Atlantic 1003; g d Miss Redwood, by Redwood, son of Blue Bull 75, etc. [See Madam.] Bred by C. S. Fowler, Youngstown, Ohio. [Vol. XII.]

ALPHA Q., (6) b m foaled 1890; by Representative 7269; dam Maud Jacobs, by Walker Morrill 2557; g d Cordie, by Sherman Morgan 2626, etc. [See Maud Jacobs, Vol. VIII.] Bred by S. S. Quinn, Pocomoke City, Md.; passed to George H. Read, Read's Wharf, Va.; then to Thomas E. Lindley, Eastville, Va. [Vol. XII.]

ANTIETA 21492, (6) b h foaled 1892; by Artillery 750; dam Twinkle, by Footlight 2909; g d Nelly, by Vimont 1925, etc. [See Twinkle, Vol. VIII.] Bred by S. J. Moore, Lexington, Ky.; foaled the property of E. E. Zuck, Mount Pleasant, Pa. [Vol. XII.]

ANTONIO W. 20849, (6) b h foaled 1891; by General Wilkes 8493; dam Laura M., by Happy Medium 400; g d Molly Blackford, by Mambrino Boy 844, etc. [See Laura M., Vol. VIII.] Bred by R. J. Cook, Lexington, Ky.; passed to E. L. Housh, Maquon, Ill. [Vol. XII.]

ARCH, (6) b m foaled 1892; by Lexington 8579; dam Katie C., by Mambrino Howard 3656; g d Meteor 2:31, by Clark Chief 89, etc. [See Katie C., Vol. VII.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

BASHY WILKES, (6) bl m foaled 1892; by Galileo Rex 12347; dam Fanny Douglas, by Bashaw 50; g d Nancy Bell (dam of Fred Douglas 2:20¼, and Tom Kirkwood 2:29¼), by Morgan (Gale's), etc. [See Fanny Douglas, Vol. X.] Bred by J. Q. Spain, Hartford, Iowa; passed to Henry Plumb, Des Moines, Iowa. [Vol. XII.]

FRANK GILLIG 21431, (6) b h foaled 1891; by Gillig 14258; dam Lady Snip (dam of Levi Aristos 2:26½), by William Tell, son of Ti Boy. [See Lady Snip, Vol. IX.] Bred by J. Fred Nadeau; passed to J. W. Wyman, Crown Point, N. Y. [Vol. XII.]

HABITANT 20154, (6) bl h foaled 1892; by Herod 510; dam Lucille, by Masterlode Jr. 2920; g d Nelly S., 2:41¾, by Swigert 650; g g d Nelly Silvernale (dam of Silvernale 2:25), by Black Hawk (Gipson's), etc. [See Lucille, Vol. VIII.] Bred by M. T. Grattan, Preston, Minn.; passed to F. W. Beardsley, Gibson City, Ill. [Vol. XII.]

LADY B., (6) b m foaled 1888; by Woodland 6731; dam Maud (dam of Maud Mace, 2:27¼), by Quaker General, son of General Knox 140; g d Bess, by Bismarck Jr., son of Bismarck (Howe's), etc. [See Maud.] Bred by F. D. S. Brown, East Wilton, Me. [Vol. XII.]

LADY BARON, (6) b m foaled 1889; by Baron Wilkes 4758; dam Daisy Blackwood, 2:29¼, by Blue Bull 75. [See Daisy Blackwood Vol. VII.] Bred by R. G. Stoner, Paris, Ky.; passed to Charles T. Luthy, Peoria, Ill. [Vol. XII.]

MABEL CHIMES, (6) b m foaled 1892; by Chimes 5348; dam Sweetwater, by Mambrino King 1279; g d Gale Mare by Almont Jr. 1829, etc. [See Sweetwater, Vol. VII.] Bred by Henry Smith, Buffalo, N. Y.; passed to Noah T. Wood, Mapleton, Iowa. [Vol. XII.]

MAGGIE HARTWOOD, (6) br m foaled 1891; by Smuggler 927; dam Hartwood Violet, by Hartwood 1213; g d Violet, by Administrator 357, etc. [See Hartwood Violet, Vol. VII.] Bred by F. G. Babcock & Son, Hornellsville, N. Y.; foaled the property of H. L. Asher, Lexington, Ky.; passed to J. P. Hanaford, Chadwick, Ill. [Vol. XII.]

MINNIE CONSUL, (7) ch m foaled 1891; by Sir Consul 9661; dam Minnie Warren, by Diamond Volunteer 17660. Bred by S. E. Gates, Newton, Iowa. [Vol. XII.]

NORA, (9) gr m foaled 1879; by General Stanton 2545; dam Anna H., by Norman Messenger. Bred by Patrick Healey, Niagara, Ont., Can.; passed to E. P. Healey, St. Catharines, Ont., Can. Record 2:31½. [Vol. XII.]

PALOMA 21901, (6) bl h foaled 1891; by Bradtmoor 19616; dam Capella, by Steinway 1808; g d Kishenkower, by Hamlet 160, etc. [See Capella, Vol. XI.] Bred by Rush & Hastings, Suisun, Cal.; passed to Charles Riedy, Escondido, Cal. [Vol. XII.]

Digitized by Google

PERLETTA, (6) b m foaled 1892; by Patchen Wilkes 3550; dam Dinnie, 2:25, by Rochester 616; g d Miss Coons (dam of Wilson, 2:16¼, Clarkia, 2:27, etc.), by Clark Chief 89, etc. [See Dinnie, Vol. VI.] Bred by Henry C. Jewett & Co., Jewettville, N. Y.; passed to Charles T. Luthy, Peoria, Ill.[Vol. XII.]

POGIS STANTON 19979, (6) ch h foaled 1886; by General Stanton 2545; dam Winona Maid, by Winfield Scott 1319; g d Dell (dam of Forest Boy, 2:25¼), by Tempest, etc. [See Winona Maid.] Bred by J. Carpenter; passed to Mrs. J. Carpenter, Winona, Ont.; then to Thomas Barnes, Hamilton, Ont.; then to W. G. Barnes, Green River, Ont. Can. [Vol. XII.]

RAWDON 21589, (6) b h foaled 1888; by Dictator 113; dam Servia, by Alcyone 732; g d Hagar, by Abdallah 15, etc. [See Servia, Vol. X.] Bred by H. C. McDowell & Son, Lexington, Ky; passed to Ellis & Scott, Philadelphia, Pa.; then to William Shireman, Middletown, Pa. [Vol. XII.)

RUSSELL MCGREGOR 21721, (6) ch h foaled 1892; by Robert McGregor 647; dam Lotta, 2:24½, by Florida, 482; g d Kate Porter, by Daniel Lambert 102, etc. [See Lotta, Vol. V.] Bred by John L. Russell, Troy, N. Y. [Vol. XII.]

SITKA CHIMES, (6) br m foaled 1891; by Chimes 5348; dam Electra, by Alcyone 732; g d Maud S. T., by Governor Sprague 444; g g d Belle Patchen, 2:30¾, by Mambrino Patchen 58, etc. [See Electra, Vol. VI.] Bred by H. H. Darlington, Concordville, Pa.; passed to Henry Smith, Buffalo, N. Y. [Vol. XII.]

SUMMER GIRL, (6) br m foaled 1891; by Stanmont 21826; dam Hickory Maid, by Sir Robert Stanton 13896; g d Kitty Hudson (dam of Henry R., 2:25½), said to be by Frank Porter. [See Hickory Maid, Vol. X.] Bred by Arthur Lloyd, St. Catharines, Ont., Can. [Vol. XII.]

TELLURIAN, (6) bl m foaled 1892; by Lexington 8579; dam Medio, by Cooper Medium 11731; g d Hattie by Petoskey 3633, etc. [See Medio, Vol. IX.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

TEMPAAN, (7) b m foaled 1892; by The President 11545; dam Hannah D., by Abdalbrino 2646; g d Becky B., by Bourbon Abdallah, son of Abdallah (Hursts & Thornton's), etc. [See Hannah D., Vol. IX.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

TINGLE TOSKA, (6) b m foaled 1892; by Kingtoska 5802; dam Bru-du-Net, by Larkin 3070; g d Queen, by Crusader, 434, etc. [See Bru-du-Net, Vol. XI.] Bred by Arthur E. Tingue, Cobleskill, N. Y., foaled the property of W. H. Gearhart, Scranton, Pa. [Vol. XII.]

TOM GILLIG 19866, (6) ch h foaled 1891; by Gillig 14258; dam Gipsey, by Ben Franklin 753; g d by Ethan Allen 860. [See Gipsey, Vol. IX.] Bred by B. J. Williams, Brandon, Vt.; passed to George A. Graves, Boston, Mass. Record, 2:37¾. [Vol. XII.]

TOWER, (7) b m foaled 1892; by Lexington 8579; dam Helen R., by Abdalbrino 2646; g d Becky B., by Bourbon Abdallah, son of Abdallah (Hurst & Thornton's), etc. [See Helen R.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

TURRET, (7) b m foaled 1892; by The President 11545; dam Clio, by Homer 1235; g d Nannie, by Halcorn, etc. [See Clio, Vol. IX.] Bred by P. P. Johnston, Lexington, Ky. [Vol. XII.]

ULAH, (6) br m foaled 1889; by Baron Wilkes 4758; dam Brownie (dam of Baron Browne, 2:26¼, and Haldane, 2:26½), by Daniel Lambert 102; g d Jenny (dam of Nonesuch, 2:25½, Col. Moulton, 2:28½, etc.), by Bigelow Horse, son of Black Hawk 5. [See Brownie, Vol. IV.] Bred by R. G. Stoner, Paris, Ky.; passed to Charles T. Luthy, Peoria, Ill. [Vol. XII.]

VANITY, (7) bl m foaled 1888; by Bayonne Prince 2939; dam Blanche Warwick, by Warwick Boy 3368; g d Blanche, pedigree not traced. Bred by Philip Jermer, New Market, N. J.; passed to Michael Quinn, Plainfield, N. J. [Vol. XII.]

VI, (7) b m foaled 1890; by Benzon 2471; dam Madam, by Atlantic 1003; g d Miss Redwood, by Redwood, son of Blue Bull 75, etc. [See Madam.] Bred by C. S. Fowler, Youngstown, Ohio. [Vol. XII.]

White Cloud 016, (3) gr h foaled 18—; by Telegraph; dam not traced. Bred by John Blevins; passed to George W. Jones, Huron, Ind.; then to James Marley, Orleans, Ind.; then to John Greyer, New Orleans, La.; then to T. N. Braxtan, Paoli, Ind. Died January, 1892. Sire of *Flora Belle*, 2:13¾; *Bessie M.*, 2:21, etc. [Vol. XII.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

MADAM, b m foaled 1883; by Atlantic 1003; dam Miss Redwood, by Redwood, son of Blue Bull 75; g d Kitty B., pedigree not traced. Bred by S. Montgomery, Orwell, Ohio; passed to R. W. Davis, West Williamsfield, Ohio; then to Norman Ripple; then to C. S. Fowler, Youngstown, Ohio. [Vol. XII.]

SANTONIN 2D, ch m foaled 1877; by Ledger 1669; dam Dot, pedigree not traced. Bred by Frank M. Moore, Lowellville, Ohio; passed to R. D. Burnett, Coitsville, Ohio; then fo C. S. Fowler, Youngstown. [Vol. XII.]

RECORD OF OFFICIAL TRANSFERS.

NOTE.—When registered animals change owners the transfer may be recorded here and will be carried into the next volume of the Register, thus maintaining the identity of the animal with the new ownership. The fee is twenty-five cents.

ACOSTA, bl m foaled 1881; by Almont Rattler 500; dam Lady Sherman, by Billy Sherman, son of Jesse Stow, etc. [See Vols. V and XI.] Passed to C. A. Hayes and H. Dettloff, Chippewa Falls, Wis.

ADNA, (7) bl m foaled 1888; by Director 1989; dam Lady Salisbury, by Mambrino Patchen 58, etc. [See Vol. IX.] Passed to J. De Witt Butts, Rochester, N. Y., December 2, 1892.

ADELAIDE, (2, 6) b m foaled 1878; by Milwaukee 603; dam Minnie B, by Bay Mambrino, son of Bay Chief (Alexander's), etc. [See Vol. V.] Passed to Charles Schwartz, Chicago, Ill.; then to William R. Merriam, St. Paul, Minn.; then to W. H. Wilson; then to Estate of W. H. Wilson, Cynthiana, Ky.; then to Marcus Daly, Hamilton, Mont. Record 2:18.

ALICE W., (6) b m foaled 1889; by Combat 1038; dam Ailemeth, by Capoul 1037, etc. [See Vol. VIII.] Passed to Arthur Leek, Hadleigh, Suffolk, Eng.

ALMONT CHAMPION 5522, (7) b h foaled 1881; by Almont Lightning 1023; dam Stella Champion, by Mambrino Champion 5130, etc. [See Vols. VI and VII.] Passed to James Baptie, Springville, Ont., Can. October 19, 1892.

ANDERSONIAN 18842, (6) b h foaled 1890; by Anderson Wilkes 4197; dam Irene, by Durango 1115, etc. [See Vol. XI.] Passed to A. G. Danforth, Washington, Ill., February 10, 1892; then to R. L. Owen, Caney, Kan., November 19, 1892.

ANNICE, (7) b m foaled 1890; by Monte Carlo 2429; dam Lottie Clay, by Signal 8687, etc. [See Vol. IX.] Passed to Augustus Sharpe, Louisville, Ky., November, 1891; then to T. J. Harbaugh, Columbus Grove, Ohio, March, 1892.

ANNIE LAURIE, (6) b m foaled 1889; by Nutmeg 2459; dam Beatrice, by Mambrino Patchen 58, etc. [See Vol. X.] Passed to Cadwell & Everts, Chicago, Ill.

ANTHEM, (7) b m foaled 1889; by Winewood 4874; dam Chloral, by Young Wilkes 951, etc. [See Vol. IX.] Passed to C. Crawford, Grand Rapids, Mich., December 5, 1892.

BANNER BEARER 7134, (1) b h foaled 1886; by Standard Bearer 5300; dam Maggie Clay, by American Clay 34, etc. [See Vol. VII.] Passed to Clinton Brown, Homer, Ill. Record 2:28½.

BELLE ALLEN, (6) b m foaled 1885; by Ethan Allen 473; dam Virgin, by Cassius M. Clay, Jr., 22, etc. [See Vol. VI.] Passed to C. C. McKinney; then to D. S. Ragon, Evansville, Ind.

BELL ELECTA, (6) b m foaled 1888; by Piedmont 904; dam Alta Belle, by Electioneer 125, etc. [See Vol. IX.] Passed to J. B. Dutcher & Son, Pawling, N. Y.

BERLINTON 7984, (6) br h foaled 1886; by Walkill Prince 2797; dam Daisy, by Star Hambletonian 1534, etc. [See Vols. VII and IX.] Passed to S. M. Highley, Converse, Ind., September 29, 1892.

BONDSMAN 11899, (6) b h foaled 1889; by Prince L. 5947; dam Belle, by Dick Linderman 2311, etc. [See Vol. IX.] Passed to J. A. Gauntt, Marion, Ind.

BONNIE BELLE, (6) br m foaled 1888; by Lyle Wilkes 4658; dam Shirley, by King Rene 1278, etc. [See Vol. XI.] Passed to J. E. Kitzmiller, Canton, Ohio.

BROWN 4011, (1, 6) br h foaled 1884; by Combat 1038; dam Gauntlette (dam of Williams, 2:20½), by Dictator 113, etc. [See Vol. VI.] Passed to J. I. Case, Racine, Wis., then to M. Galvin, New York, N. Y.; then to George H. Ketcham, Toledo, Ohio, January 11, 1893. Record 2:18¾.

Digitized by Google

CHESTNUT MILLS 13879, (6) ch h foaled 1890; by Chestnut Wilkes 11410; dam Miss Kelly, by Blue Bull 75, etc. [See Vol. IX.] Passed to J. W. Ward, Grand View, S. Dak., November, 1892.

CHOICE, (6) b m foaled 1882; by Dictator 113; dam Carol, by Clark Chief 89, etc. [See Vols. V and VI.] Passed to W. H. Wilson, Cynthiana, Ky.; then to A. M. Hamilton, Wheeling, W. Va.; then to Kate E. Robinson, Fremont, Mich.

CLUSINA, (6) b m foaled 1890; by California 4132; dam Zenobia, by Egbert 1136, etc. [See Vol. X.] Passed to Cadwell & Everts, Chicago, Ill.

COLETA, (7) b m foaled 1888; by Mogul 1724; dam Lucy, by Frank Martin 6732, etc. [See Vols. VIII, and XI.] Passed to John A. Macauley, Philadelphia, Pa., April 25, 1892.

CORNER BELLE, (6) b m foaled 1890; by Bell Boy 5350; dam Four Corners, 2:20¼, by Mambrino Time 1686, etc. [See Vol. IX.] Passed to J. B. Dutcher & Son, Pawling, N. Y.

DAHLIA, (7) gr m foaled 1888; by Dictator Jr. 2193; dam Molly, by Bayard 53, etc. [See Vol. IX.] Passed to A. E. Woods, Hume, Ill.

DALGAMO 13047, (6) bl h foaled 1878; by Dictator 113; dam Amanda (dam of Strathwood, 2:31¾), by Blackwood 74, etc. [See Vol. IX.] Passed to Marcus Daly, Hamilton, Mont.

DIVER 5400, (6) gr h foaled 1885; by Onward 1411; dam Siren, by Dictator 113, etc. [See Vol. VI.] Passed to Steele Bros., Lexington, Ky.; then to A. B. Grove, Newark, Ohio.; then to Dygert Bros., Springville, N. Y., October 25, 1892.

DORA M., (7) b m foaled 1884; by Billion 7075; dam Dolly, by Vermont 104, etc. [See Vols. VIII and IX.] Passed to J. T. Baltzell Jr., Altoona, Pa., May 1892.

EAGLESS, (7) ro m foaled 1888; by Eagle Bird 5867; dam by Balsora 1024, etc. [See Vol. IX.] Passed to G. W. Campbell, Parkersburg, W. Va.

EDGARDA, (7) b m foaled 1886; by Bay Tom 16481; dam Em Kimberly, by Wild Bashaw 698, etc. [See Vol. XI.] Passed to Frank Jacobs, Youngstown, Ohio, 1892.

THE J. H. FENTON CO.,

MANUFACTURERS ONLY OF

First-Class Horse Goods,

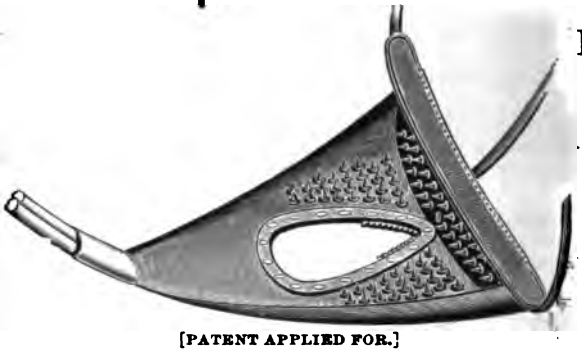
Practical, Humane and Intricate Appliances for Producing Speed in Colts and Horses, desires to call your attention to

Our Latest Improved Stallion Shield.

It Advertises Itself.

300

Sold in 1891 on its own Merit.



Has done in Preventing What No Other SHIELD Has Done.

[PATENT APPLIED FOR.]

NOTE.—The above cut represents THE J. H. FENTON CO.'S LATEST IMPROVED STALLION SHIELD, which we guarantee as an **absolute preventive.** It is made out of moulded rubber with projections containing blunt-pointed pins, which cannot injure the horse. There is AN OPENING IN THE CENTER of the Shield so as to allow the horse perfect freedom. Never becomes foul. Harness supporting Shield is so constructed that, after once adjusted to fit the horse, no buckling or unbuckling of straps is necessary in placing on or taking off the Shield.

Price, $6.00 Each.

BREEDERS and **TRAINERS** will find it to their interest to correspond with us before placing their orders, as we

MANUFACTURE SPECIALLY TO ORDER, FROM MEASUREMENT,

SONS AND DAUGHTERS
GRANDSONS AND
GRANDDAUGHTERS OF

ELECTIONEER

FOR SALE.

Also Choice Brood Mares in Foal to St. Bel, Electric Bell, Conductor, May King, Legal Test and Connoisseur.

STALLIONS THAT CAN BEAT 2:20.

MARES THAT CAN BEAT 2:20.

All stock selected by our Mr. Sibley after the most careful study of family and individual merit during many yearly visits to Palo Alto Farm.

Stallions will be sold at figures that will let them earn their cost in a single season in the stud. We do not know of an Electioneer stallion that does not have a full book before the season opens. For nicking with the blood of the Wilkes, Nutwood, and other great trotting families experience has shown how great the results.

Five years ago we predicted that Electioneer would lead all other stallions, living or dead. To-day he has 100 trotters with records of 2:08¼ to 2:30, and only one pacer. His get hold the two, three, four, and five year old records. the world's record, and the stallion record. Thirty-seven trotters by him entered the 2:30 list for the first time in 1891, with records of 2:10¾ for a two-year old, 2:26¼ for a yearling, etc. Next season ought to be the best in their history. Electioneer has comparatively few sons, and they are all siring trotters: pure gaited, no hobbles, no toe weights, no pacers. Don't write, but come and see what we have for sale. All will be priced reasonably, except Electric Bell, Belsire and Cecilian, who are not for sale, and will be private stallions for 1892. Send for Catalogue.

Read what BUDD DOBLE says about

AXLE, 14650.

CHICAGO, December 12, 1892.

A. C. BRUCE, ESQ., Minneapolis, Minn.:

Dear Sir—In reply to your inquiry as to my opinion of your two-year-old colt, Axle, which has been a member of my stable during the past season, I take pleasure in stating that he had, from the very start, more natural speed than any colt I have ever seen or trained. In this particular I have always regarded him more than phenomenal, as he showed me as good as a 2:08 gait in the month of May, and had I not been unfortunate in the management of the colt, I am confident I could have given him a record of 2:15 or better, this year. His gait is so perfectly natural, graceful and easy, that it seems almost limitless in speed capacity, and in consequence I predict for him a brilliant future turf career, as well as renown as a sire of early and extreme speed.

Yours truly,

BUDD DOBLE.

NOTE.—AXLE, 14650, record, (2 yrs.) 2:26¼, foaled 1890, is a handsome black colt of good size, great quality, superior style and perfect action. He is choicely inbred to Hambletonian, George Wilkes, Mambrino Chief, Mambrino Patchen and Henry Clay. He has two crosses to Edwin Forrest and traces to Pilot, Jr. and American Star through exceptional producing channels. His pedigree is well sustained by the strongest thoroughbred blood. He traces 23 times to Imp. Messenger, and 18 times to Imp. Diomed.

ARCADIAN, 2687. Record, 2:23 1-2. By Egbert, 1136, dam Laura, by Almont; 2d dam Puss (in Great Brood Mare List) by Brown Chief, 4445.

$50.00 the Season.

HERBERT, 6561. By Adrian Wilkes, 6560, dam by Mambrino Abdallah, 2201. Brother to Lillian, 2:21¼, and Waterloo Boy, 2:14¾.

$25.00 the Season.

Return privilege granted when mares are not in foal if horses do not change ownership. For particulars address,

Humphreys' Veterinary Specifics

For Cure of Diseases of Horses, Cattle, Sheep, Dogs, Hogs and Poultry.

That the diseases of Horses, Cattle, Sheep, Dogs, Hogs, and Poultry, are daily cured by *Humphreys' Veterinary Specifics*, is as true as that people ride on railroads, send messages by telegraph, or sew with sewing machines. It is as irrational to bottle, ball, and bleed animals in order to cure them, as it is to take passage in a sloop from New York to Albany.

Used with Perfect Success in extensive Stock Farms, and for the most valuable stock, and are even endorsed by the *U. S. Army Cavalry Officers.*

SPECIFIC A. A. cures **FEVERS, CONGESTIONS and INFLAMMATIONS** as of the Lungs, Brain, Eyes, Throat, or Bowels; Staggers, Fits, Milk Fever, Spinal Meningitis, Hog Cholera, etc.

SPECIFIC B. B. cures **STRAINS, LAMENESS, FOUNDER, SPAVIN,** Diseases of the Joints and Tendons, Rheumatic Stiffness.

SPECIFIC C. C. cures **DISTEMPER,** Nasal Discharges, Swelled Glands, Sore Throat, Epizootic, Grippe.

SPECIFIC D. D. cures **BOTS or GRUBS,** Long, Round, Pin or Tape Worms.

SPECIFIC E. E. cures **COUGH, HEAVES,** Broken Wind, Inflammation of the Lungs, Labored Breathing.

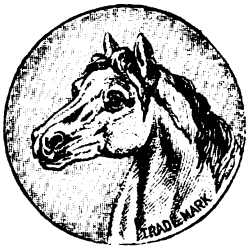
SPECIFIC F. F. cures **COLIC,** or Gripes, Belly-Ache, Dysentery, Diarrhea, Hoven or Wind-Blown.

SPECIFIC G. G. prevents **ABORTION,** or casting of Foal or Calf, Sterility.

SPECIFIC H. H. cures **URINARY and KIDNEY DISEASES,** Scanty Difficult Staling, Inflamed Kidneys, Dropsy, Swelled Legs.

SPECIFIC I. I. cures **ERUPTIVE DISEASES,** Scratches, Mange, Farcy, Erysipelas, Abscesses, Fistulas.

SPECIFIC J. K. cures **DISEASES OF DIGESTION,** Constipation, Indigestion, Jaundice, Convulsions and Paralysis, Seminal Weakness.



The cut of a Horse's Head is our Trade-Mark on Veterinary Medicines; we have the exclusive right to use this cut on packages, books, advertisements, etc., in connection with the same. Infringers will be prosecuted
